INDEX TO VOLUME I FOR 1937

READERS in search of a particular subject will find it useful to bear in mind that the references are in several cases distributed under two or more separate but nearly synonymous headings—such, for instance, as Brain and Cerebral Heart and Cardiac Liver and Hepatic, Renal and Kidney, Cancer and Carcinoma, Epithelioma Malignant Disease, New Growth, Sarcoma, etc. Child and Infant, Bronchocele Goutre and Thyroid Diabetes, Glycosuria, and Sugar, Light Roentgen Radium, X Rays Status Lymphaticus and Thymus, Eye, Ophthalmia, and Vision, Pyelography and Urography, Lunacy and Mental Diseases Sunlight and Ultra violet Bicycle and Cycle, Motor and Automobile Association Institution, and Society, etc. Subjects dealt with under various main headings in the JOURNAL have been set out in alphabetical order under their respective headings—for example 'Annotations,' 'Correspondence' 'Leading Articles' 'Reviews,' etc. Original Articles are indicated by the letter (O) For Obituary Notices see under Names of Individuals

A

- ABBOTT Maude L.L.D., of McGill University conferred upon, 65—*Atlas of Congenital Cardiac Disease* rev, 970
- ABDEEN M.O. An adenoid curette 1073
- ABERHARDEN Emil sixtieth birthday of 693
- ABEL A. Lawrence Some common diseases of the rectum and anal canal 1207 (O)—*Modified Clifton's proctoscope* 1317
- Aberdeen. See Scotland
- Abortion, causes of (C. Weysser) 903
- Abortion, committee on (parliamentary note) 1142
- 1167—Constitution of 1167
- Abortion criminal, in France 621, 633
- Abortion criminal pathology of (W. H. Grace) 727
- Abortion, habitual (P. A. McCallum) 1223
- Abortion, habitual and stillbirth syndrome and late pregnancy toxæmia (James Young) 953 (O)
- Abortion and the law 418
- Abortion problem of in New Zealand report 105—
- Abortion, when is it lawful? (leading article) 393—
- Correspondence on, 470
- Abortion, repeated treatment of (Lilias M. Blackett Jeffries) 323
- ABRAHAM, Margery (and Elsie M. Widdowson) *Modern Dietary Treatment*, rev 1206
- Abcess, cerebral acute treatment of by puncture (Gunn) 616
- Abcess pericerebrum a physical sign in (John T. Morrison) 71
- Abcess, retropharyngeal 508
- Abcess, typhoid 57 years later (P. Phillips and R. T. Cooke) 219—Correspondence on 635
- ABSE, Philippe sentenced to penal servitude for false pretences 1345
- Absorption, review of books on, 558
- ABT Isaac A. (editor) *The 1830 Year Book of Paediatrics* rev 755
- Academic co-tune 430 452, 594
- ACADEMY ROYAL OF MEDICINE IN IRELAND
- Section of Medicine Need for a National Serum Institute, 883
- Section of Obstetrics Endometriosis, 778—Encysted endometrioma 779—Vaginal hysterectomy 779—Varicose veins in pregnancy 993—Pregnancy in diabetes 994
- Section of Surgery Renal tuberculosis 137—Subdural aneurysm 411—Stone in the upper urinary tract 829
- Accident and diabetes mellitus, 634 784
- Accidents cerebral vascular (O. M. Hinda Howell) 255 (O)
- Accidents In coal mines, numbers (parliamentary note) 1344—Juvenile rate (parliamentary note) 201—Motor and alcohol, 836—Motor and alcohol (H. M. Vernon) 188—Review of book on 152—Road (parliamentary note) 54 647—Necropsy after 83—Campaign of the Road Accidents Emergency Council, 161 23—Numbers 647
- Accidents rehabilitation after Report of Committee 1218
- Accommodation paralysis of as the result of internal administration of stramonium (Humphrey Neame) 409
- Acetic acid and vinegar (parliamentary note) 54
- Acetylcholine action of on the central nervous system (leading article), 1123
- Acetylcholine, action of on skeletal muscle 873
- Achondroplasia 952
- Actinotherapy Mobile light treatment unit for ward work, 1026
- ADALJA K. V. Acquired haemophilia, 785
- ADAM, James Sclerosing submucosal injection of the turbinates, 245 416
- ADAMS, A. Congenital cystic disease of the lungs
- ADAMS, A. Wilfred Continuous intravenous saline infusion, 636—Prevention of constipation, 1336
- ADAMS, James obituary notice of 1098
- ADAMS S. B. Low voltage near-distance x-ray therapy 1276
- ADAMS W. Strick Otitis media in early childhood 1084
- ADAMSON Rhoda Rupture of the uterus, 201
- ADDS, W. R. Cystic degeneration of the endometrium 409—Pathogenesis of eclampsia 1103 (O)
- ADDISON Christopher created a Baron, 1032, 1041 7351—To take the title of Lord Addison of Stalling borough in the County of Lincoln 1351
- ADDISON F. A. Sweet chestnuts in epidemic jaundice, 1046
- Addison's disease (A. W. Spence) 279
- Addison's disease associated with hyperthyroidism examination of the endocrine system in (O. Bintl) 678
- Adenoid curette. See Curette
- Adenomyoma causing intestinal obstruction (A. Gough) 993
- ADLER Alfred, obituary notice of, 1180 1227
- Adrenal cortex (L. R. Broder and H. W. C. Niles) 602 (O)—(W. N. Kemp) 1194 (O) 1221—Discussion, 1221
- Adrenal gland, physiology of (S. Levy Simpson) 229
- See also Gland
- Adreno-genital syndrome and tumours of the suprarenals (A. W. Spence) 338
- ADRIAN Edgar Douglas, elected to the Chair of Physiology at Cambridge 638
- Aerial. See Air
- Africa tuberculosis problem in (Charles Wilcocks) 1039
- AGASSIZ, O. D. S. Artificial pneumothorax in children, 1267
- Agria and Oudh, child welfare in, report 933
- Aggranulocytosis and allergy 143
- Aggranulocytosis, chronic, successfully treated with liver (O. R. Das Gupta and L. J. Wilks) 1197 (O)
- Aggranulocytosis, fulminating (O. K. G. Owyer) 18
- Aggranulocytosis, rheumatic 45
- Agricultural education and research, supplementary estimate for (parliamentary note) 856—The vote on 1205—Animal diseases Government policy (parliamentary note) 1293
- AKISWORTH DAVIES J. C. Frequency of micturition in the adult, 37
- Air ambulance work, 1328
- Air conditioning discussion at the Royal Society of Medicine 1171
- Air relief by International Conference in, 1323
- Air raid 308, 309 426, 429 403 638 591 613 648 1009 1055 1091 1179 1230 1282, 1291 1339—Anti-gas equipment local schemes, Government to help cost of (parliamentary note) 309—Anti-gas school at Fairfield civilian officers of Government Departments to undergo instruction at (parliamentary note) 309—Anti-gas treatment instruction of doctors in (parliamentary note) 426—Bomb-proof shelters (parliamentary note), 1055—Gas masks, distribution of (parliamentary note) 308 426—Regional store depots for (parliamentary note), 429—Filter material in (parliamentary note) 602—Issue of to civilians (parliamentary note) 1291—Gas-proof shelters, public (parliamentary note) 538—Medical instruction in (parliamentary note) 648—Poison gas protective measures criticised (parliamentary note) 426—Precaution correspondence on 1091 1230 1282, 1339—Precautions in London, 403 1009—In Wandsworth, instruction in 1008—Respirators and concentrated gases (parliamentary note) 591—Review of book on, 613—Westminster, Palace of, protection of (parliamentary note) 692
- Air transit for pregnant women 420 See also Pregnant
- Airway cap an anaesthetist (Herbert Charles) 449
- AITKEN, Charles J. Hill The saliva in diphtheria 56—What about ourselves? 733
- AITKEN Isabella Machado Malcolm obituary notice of 812
- AITKEN J. B. appointed Serving Brother of the Order of St. John of Jerusalem 169
- AITKEN McCrae Ununited fractures 578
- AITKEN Robert Lupus vulgaris, with special reference to its treatment with the Fincken Lomholt lamp 160 (O)
- ALAJOUANISE Th. (and H. Thurel) *Les Spasmes de la Face et leur Traitement* rev 1310
- ALBOT G. Tuberculosis hepatitis 36
- Alcohol or insulin? Mock trial held by the Fellowship of Medicine 644

Coramine

'Ciba'

A non-toxic circulatory and respiratory stimulant for oral, hypodermic, intravenous and intracardiac administration, improves the pulse and blood pressure, reinforces the contractions of the myocardium. Increases the respiratory amplitude, activates the ventilation of the lungs causing cyanosis to disappear.

Indicated in collapse, coma, accidents during narcosis, poisoning by coal gas, narcotics and barbitone derivatives, fatigue phenomena, etc.

BRONCHOSPASM AND ASTHMA

A booklet surveying this subject, which includes diagrams and illustrations, has recently been published and has been sent to all members of the Medical Profession. You are invited to send for a copy should this have failed to reach you.

"THE LANCET" writes (28/4/34, p. 929) —

"We have received a pamphlet on Bronchospasm and Asthma written to bring before the medical profession the value of Felsol in the treatment of asthmatic subjects. The powder can be prescribed by the medical man in accordance with the definite regime which he decides to adopt in the treatment of a case the claim for Felsol being that its administration relieves promptly the attack of asthma by its influence over bronchial spasm so that only the most severe cases would require the injection of morphia."

MODERN AIDS TO HEARING

These announcements are intended to illustrate the latest advances in acoustic science in order that the medical profession may be kept informed of the newest aids available for the deaf.

"Radio-Aid"

This aid completely answers the demand for a small valve amplifier. It is the result of many years' patient research into the problem of reducing the size of a valve amplifier to dimensions comparable with those of the non valve type. It is very small, light in weight, powerful, compact and easy to maintain.

A small jelly acid accumulator and dry H.T. battery operate the instrument and up to 100 sets are therefore very low.

For full details of the Radio-Aid and all types of hearing aids, please apply to the following:

PRACTICAL METHODS IN THE DIAGNOSIS AND TREATMENT OF VENEREAL DISEASES

(Third Edition)

Revised by
ROBERT LEES
 and other contributors

We have no hesitation in saying that this is the best work on the subject that has appeared in the last few years. In the reviewer's opinion it is one of the best of its kind in the English language, for although it is a small volume it may have been published during the last few years. It is a student who requires a textbook of this kind, and it is a practical reference work for the Practitioner. (24 pp 5s 6d net)

AMEN HOUSE, WARWICK SQUARE, LONDON, E.C.4

84% of English Doctors* prefer a mild cigarette!

WARWICK CASTLE

"Of course the doctors are right in preferring mild cigarettes. In what's called 'modern comedy,' which I play in mostly, voice-raising is barred—my voice must carry at the smallest volume. So I look after my throat—I smoke Kensitas. They're mild and so they do not irritate the delicate throat membranes."

Owen Nares

MR. OWEN NARES, one of the greatest favourites on the British stage

In a recent independent survey, an overwhelming majority of lawyers, doctors, lecturers, scientists, etc., who said they smoked cigarettes, expressed their personal preference for a mild cigarette.

Mr Nares verifies the wisdom of this preference and so do other leading artists of radio, stage screen and opera, whose voices are their fortunes, and who choose KENSITAS a mild cigarette. You, too, can have the throat protection of KENSITAS—a mild cigarette, free of certain harsh irritants removed by the exclusive KENSITAS Private Process.

* 84% of English doctors, who smoke cigarettes, as shown by replies to a strictly independent survey, prefer a mild cigarette.

Kensitas. the MILD cigarette

"Just what the Doctor ordered"

A Genuine Service for Deaf Patients

- 1 An audiometer test to determine the amount of hearing loss
- 2 Adaptation of a suitable aid to conform to individual requirements
- 3 A trial of the selected aid at home, without obligation to purchase
- 4 Submission of a full report to the doctor concerned, enabling him to supervise the trial
- 5 A guarantee covering any alterations made necessary by changing aural conditions,
- 6 Every known type of hearing aid available, Valve amplifiers, Air conduction, Bone conduction, Nerve deafness aids and full non-electric range

Members of the Medical Profession are invited to make full use of the service offered, with every confidence that genuine assistance will be rendered in the selection of a suitable hearing aid

HEAT THERAPY MADE SAFE

Treatment by heat or by immersion with pure
Infrared rays, pure oxygen, CO₂ etc. Equipment as
shown in picture is an ordinary slipper bath

Doctors may enjoy a demonstration Zotofoam treat-
ment in their own Homes free of obligation. Use
the Allen & Hanburys Form below

TO SOALLESS FOAM LTD.
111, Lisle Street, (T.G. Lister) W.1
Infrared rays, pure oxygen, CO₂ etc. Equipment as
shown in picture is an ordinary slipper bath

The Importance of Zotofoam Treatment

Heat therapy needs no introduction to the doctor, but heat therapy as provided by the Zotofoam bath—safe, simple and pleasant—is an innovation of the utmost importance

Zotofoam takes advantage of the remarkable insulating properties of close textured foam. Without discomfort to the patient—who sits immersed to the neck in a soft light mass of fine bubbles, breathing air or normal room temperature—Zotofoam can induce intense perspiration which, under certain conditions, is accompanied by a fall in pulse rate and blood pressure. Its benefit is further enhanced by the increasing action of millions of infra-red micro-bubbles.

Even when normal hot baths are contraindicated, patients may enjoy the efficient and curative action of Zotofoam.

THE NEW HEAT THERAPY

Zotofoam

For wounds and burns—

These urgent and acutely painful conditions indicate prompt and systematic ultra-violet irradiation with the Alpine Sun quartz lamp. Daily erythema doses on the affected limb have a powerful anodyne effect from the time treatment begins, they promote both oxidation and elimination. Healing proceeds "faster than under any other therapy." In a surprising proportion of cases, the final result is anatomical and functional cure with a minimum of scarification.

In the treatment of these and many other conditions actinotherapy is found "the most vitalizing of all measures." Effective results depend, of course, on efficient apparatus. For the technique necessary in dealing with wounds and burns, there is only one actinotherapy lamp which has found world-wide clinical approval during more than 30 years. That is, of course

— the ALPINE SUN Lamp

The Alpine Sun Lamp and other Hanovia models may be inspected at
HANOVIA SHOWROOMS 3 VICTORIA ST., LONDON S.W.1
(Phone: Whitehall 3677)

and at electro-medical dealers' showrooms in cities throughout the Empire.

1
Extensive burns of the foot—deep contused wound of the great toe. Condition on March 22

2
Condition on April 3 is the result of 10 exposures to ultra-violet rays from the quartz lamp.

LIQUOR PEPTICUS

(Benger)

"A digestive agent of extraordinary power"

Sir William Roberts, M.D. F.R.S.

Liquor Pepticus Benger is a concentrated and highly active fluid pepsin in acid solution which acts particularly upon meat, eggs and other proteid foods

The best results from the use of Liquor Pepticus are obtained when it is prescribed alone. Should the prescriber wish to combine medicaments of a tonic nature, it will be recollected that those which are free from astringency and alkalinity should be selected. In 4, 8 and 16-oz bottles. Prices 3/6, 6/6 and 12/6

MARMITE

as an aid to

Correct Nutrition

Adequate nutrition must play an important part in the Fitter Britain Campaign. The nation must be properly fed before any system of physical training can be effective.

Indolent choice of food appears to be only too common and no section of the community is immune to the disastrous consequences of malnutrition.

Physicians prescribe Marmite as a routine measure because they appreciate its intrinsic worth as a dietary adjunct and on account of the abundant evidence which exists of its prophylactic and therapeutic value.

'DETTOL' and Midwifery

The composition and properties of 'Dettol' make it a most suitable antiseptic for use in the conduct of labour. Its properties enable it to be used in really effective strengths on the skin and mucous membranes. It has been shown that when half a teaspoonful of 30% 'Dettol' is rubbed into the hands, allowed to dry and kept free from gross contamination, the skin remains insusceptible to infection by haemolytic streptococci for at least two hours.

'Dettol' has high germicidal efficiency and this is well maintained in the presence of blood, serum, pus and other organic matter. 'Dettol' is obtainable from chemists in 1/- and 3/- bottles, and in larger sizes for medical and hospital use. These prices do not apply in the Irish Free State and Overseas. Samples and full information on request.

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for Alasil the improved form of salicylate medication.

Alasil is a very definite advance on ordinary compounds of salicylic or acetyl salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro intestinal sequelae. This high tolerability is due to the fact that Alasil is composed of calcium acetyl salicylate—the least irritating of the salicylate compound—and Alocol (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid.

A careful series of experimental tests has shown that Alasil is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach.

Wide clinical experience anticipated these findings by demonstrating that Alasil can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults the aged and patients with finely balanced digestive capacities. An analgesic antipyretic and sedative of established value.

WHOOPING COUGH

Detoxicated Whooping Cough Vaccine (Genatosan), has proved remarkably successful. Reports received from medical practitioners are that it usually reduces the frequency of the paroxysms after the first injection, and subsequent injections almost invariably clear up the condition. Owing to the elimination of the toxic elements of the germ during the process of manufacture, this vaccine may be given to infants and young children, in doses sufficiently large to produce the desired therapeutic effect, with an absence of harmful reaction.

The following is typical of many reports received from practitioners —

"I have been making a somewhat extensive use of your Detoxicated Vaccine for Whooping Cough and am pleased to say that the results have been almost invariably gratifying. In nearly all my cases the very distressing symptoms have disappeared after the third injection." M.D.

Additional information regarding this Vaccine will gladly be supplied on request.

OVOFERRIN

BRAND COLLOIDAL IRON TONIC

the rapid blood builder

It is estimated that the amount of iron in the entire body is not more than 3 gm. When this small supply is diminished, serious consequences develop. Essential iron lost through hæmorrhage, deficient food-iron or other causes, is quickly replaced by Ovocerrin.

While all forms of iron are beneficial in anæmia, it is equally true that Ovocerrin presents the iron in a form that eliminates all the undesirable qualities of non-colloidal iron.

Ovocerrin has unique advantages. It is a rapid blood builder—it does not stain the teeth—it has an agreeable taste—it is odourless—it is not astringent—it does not constipate.

it stimulates the jaded appetite—it is tolerated by the most sensitive stomach.

It is readily taken by children. Ovocerrin has all the advantages of therapeutic iron without any of its disadvantages.

The adult dose—a tablespoonful in a wine-glass of milk or water before or after meals—contains one grain of metallic iron in colloidal form held in that state by a protective protein colloid. The dose for children is two teaspoonfuls. Ovocerrin is prescribed in 11-ounce bottles.

If you have not used Ovocerrin in your practice, we shall be pleased to send you a trial bottle on request.

ANAHÆMIN B.D.H.

The anti-anæmic principle of liver

Experience in important hospitals and in the ordinary routine of clinical practice confirms on every hand the outstanding efficiency of anahæmin in the treatment of pernicious anaemia.

Not only is anahæmin remarkably effective but the cost of anahæmin therapy is exceptionally low.

In average cases of pernicious anaemia six injections usually suffice to re-establish normal blood count within six to eight weeks at a total cost to the physician of 25/- or less.

For the maintenance of the patient in a condition of robust health one monthly injection is usually sufficient.

ADVICE OF AVICENNA

AD 980-1037

Avicenna (Ibn Sina) was a celebrated Arab physician and philosopher who lived throughout the East. The Prince of Physicians was born in Afshena and died in Hamadan, D. 993.

"Remember that if the intestines are weak, purgatives excite an unduly violent and unduly prolonged action. The same is true for old persons in whom purgation is liable to be injurious." (Canon of Medicine of Avicenna) (Avicenna)

It is interesting to note that the theories regarding purgation held by Avicenna are still supported by the leaders of modern medical thought. The purgative method of treatment of constipation is regarded to-day just as it was in the 10th century as unsuitable and dangerous.

Constipation may be treated in the modern way by the use of Peflag, which by mixing intimately with the intestinal contents produces a soft faecal mass which is easily evacuated by normal peristalsis. Peflag emulsion also has an emollient, soothing action on inflamed colonic membrane and for this reason is invaluable where spastic bowel disease is present.

For the convenience of doctors and to meet the requirements of patients of any special treatment, Peflagar is prepared in four variations, one with Phenolphthalein, Alkaline and with Codeine.

Measles Control with

IMMUNE GLOBULIN (HUMAN)

Lederle

BECAUSE of the frequency of complications, the mortality rate of measles is high—higher than that for whooping cough, diphtheria and scarlet fever.

Complications can be avoided by the use of IMMUNE GLOBULIN (HUMAN) *Lederle*, particularly those of broncho pneumonia—responsible for about 50% of deaths in the infant age group (6 months to 3 years).

As a modification dose, one injection of 2 cc. is administered to patients in the infant age group from 6 to 8 days after exposure (for children in the same family this is 2 to 4 days after the appearance of rash in the exposing child). This dosage confers an active and lasting immunity in the majority of cases. For passive immunity of several weeks, a first dose of 2 cc. of IMMUNE GLOBULIN (HUMAN) *Lederle* is administered as soon as contact has been recognized, a second dose of 2 cc. four days later.

FOR THE PROPHYLAXIS OF HAYFEVER

Immunization against grass pollen toxin, the specific causative agent in hayfever, is best accomplished by a long succession of prophylactic injections commencing early, in the Spring and continued until a few days prior to the commencement of the hayfever season. Provided a sufficiently high dose is reached, patients previously highly sensitive to grass pollen can pass through the hayfever season with complete immunity from symptoms.

The frequency of inoculations will depend upon the time available. When injections are not commenced until late in March, a dose should be given every day. If treatment is delayed until May, as many as three injections daily may be necessary.

For patients who experience only mild attacks of hayfever, amelioration of the symptoms during the summer months can often be secured by far fewer inoculations than are required for the complete desensitization of severe cases.

"Pollaccine" is an extract of grass pollen prepared in the Laboratories of the Inoculation Department (Founder, Sir A. E. Wright, MD, FRS) of St. Mary's Hospital, London, and is considered to be polyvalent for the pollen of all grasses.

*Further details concerning its use for the

The structure of NIVEA-CREME

Eucerite, a substance isolated from wool-fat belongs to the group of alcohols of the meta-cholesterol series and is the substance to which wool-fat owes its hydrophylic power. After its removal the wool-fat loses its water absorbing power.

The addition of neutral hydrocarbons forms Eucerinum Anhydricum an ointment base with deep penetrating ability. It will keep indefinitely, is odourless and non-irritant and will absorb 300% of water or watery solutions.

By adding 100% of water Eucerinum cum Aqua results. It is an excellent cooling and cleansing agent for the skin owing to its ability to absorb both water and fat.

NIVEA-CREME

The scientifically based Creme, for treatment of both healthy and diseased skin.

ANGINA INNOCENS: A CLINICAL STUDY *

by

GEOFFREY BOURNE, M.D., F.R.C.P.

Physician in Charge of Out-patients and in Charge of Cardiographic Department St. Bartholomew's Hospital

For the last eight years I have fully investigated and personally followed up a large number of patients suffering from cardiac pain. The starting point in this investigation has been an analysis of the exact nature of the pain complained of. By observing the position of the pain, its radiation or lack of radiation, its relation to exercise, rest, emotion and posture, it has become clear that patients with heart disease suffer from types of pain which are as characteristic and distinct as are those complained of by patients with gastric disease. These varieties of cardiac pain differ from one another according to the underlying pathological or functional condition.

The pain of coronary thrombosis is characteristic. Its onset is sudden, its severity is greatest at the start and it tends to subside over a period of days. It may be constant during that period or may recur and remit. The pain of true angina of effort presents an equally distinct clinical picture. An intelligent patient is able to describe its exact quantitative relation to exertion—for example, a speed of one mile per hour may produce no pain, a speed of two miles per hour may result in pain after a walk of two or three hundred yards, and a faster speed or a hill will accelerate its onset. Rest invariably allows the pain to subside.

There are two further types of cardiac pain, the nature of which has not hitherto been exhaustively analysed. Spasmodic angina is an attack of cardiac pain, the onset of which may result from exercise, exposure to cold, emotion, or a heavy meal; it is relieved by amyl nitrite, but it is not exactly proportional to exertion. When once such an attack has started it will have to run its course and may increase in severity, although the patient is at rest. The nature and symptomatology of the fourth type of pain have remained unexplored; it is associated with no definite cardiac disease, is apparently of functional origin, and has a favourable prognosis.

Nomenclature

This variety of pain is the subject of the present communication. It tends to start in the left chest, frequently radiates, has no quantitative relation to exertion, and is found generally in hypersensitive or nervous subjects. The term 'pseudo angina' has in the past been applied to this syndrome, but it is a contradiction in terms, for either a patient is suffering from a pain or he is free of it. The description 'neurocirculatory asthenia' is too wide, for it embraces such other symptoms as tachycardia

*From the Cardiographic Department, St. Bartholomew's Hospital.

palpitation, and certain nervous manifestations. There appears to be no serious objection to labelling this pain 'angina innocens' for this suggests the cardiac and at the same time the innocent nature of it. There is an analogy with diabetes.

It may be thought that the word angina, even though qualified by 'innocens', is not desirable in view of the possible implication of severe cardiac disease. This objection is inadequate for two reasons. It often happens that a patient with angina innocens has been told that he has 'angina', and the same statement is perhaps more often made to the patient's relatives. One of the patients described in this paper was told at a hospital that he was suffering from angina and would have to live a very retired life. Being introspective, the young man's mind is state became such that he seriously contemplated suicide. This case shows that there may be sufficient similarity between angina innocens and angina of effort or spasmodic angina if a careful history is not taken for confusion to arise. Such a label as left subminim pain is too vague. A second reason for fixing the fact that the pain has many of the characteristics of an ordinary cardiac pain is that the patient, from hearing of acquaintances dying with substernal pain radiating to the arms, may confound the two conditions and feel that a non-committal label is an attempt at concealment or prevention on the part of his physician. It would appear more practical and more logical therefore to term the condition 'angina innocens', stressing the latter word.

The observations in this paper are based upon the detailed study of thirty-eight patients suffering from this type of pain who have been under investigation for varying periods since 1929. Simultaneously a study of a large number of patients complaining of the other forms of cardiac pain has served as a background against which the present syndrome has stood out more clearly with the passage of time.

Survey of the Literature

That cardiac pain can occur in the absence of any heart disease has long been recognized. The observation upon which this view is founded is that a patient may not die with cardiac pain and the heart may be completely normal. This variety of pain has been described in the past as 'pseudo angina' (St. Williams, 1903), 'angina nervosa' (who coined this term referred to it as 'angina nervosa' to be left undisturbed by the patient's own ideas with hyperaesthesia. Phlegm, etc., etc.), 'angina hysterica' (D. C. C. 1911), 'angina

Pain is in many cases constant though it may be accentuated by exercise and described as occurring in paroxysms or in the form of an intermittent lancinating stab. Stating that it is frequent after exertion he also observes that in a few cases the pain was not accentuated during exercise but even relieved by it. Dr Costa describes its localization near the cardiac apex and its radiation to the left arm and lays stress upon the presence of hyperaesthesia which often made the pressure of military accoutrements exceedingly unpleasant. Finally he notes that the heart rate may be fast in the erect position and slow when the patient is recumbent. Very little has since been added to this description.

Friedlander and Frickhof (1918) mention the frequency of sore throats as an aetiological factor refer to the left-sided pain and hyperaesthesia and bring out the fact that palpitation, nervousness and giddiness are common in these patients. Dimicopolu (1927) considers that although there are cases of non organic angina they are very rare. He states that the condition is commoner in women and stresses the precordial hyperaesthesia, marked tachycardia, violent palpitation and other evidence of an abnormal function of the vegetative nervous system. He also remarks that the disease is not fatal but that it is very difficult to distinguish it from organic angina. Paul White (1931) writes: "The precordial pain is a dull or heavy ache is a rule lasting for hours and not radiating. But occasionally it is interspersed with sharp stabbing sensations. A substernal oppression is unusual though circulatory ischaemia may and in fact frequently does complicate angina pectoris. An interesting analysis of patients belonging to this group was made by Doris Baker (1930). Her series was collected from a hospital outpatient department; it comprised thirty-two cases in which there was a history of up to twenty-nine years and twenty others. In these cases there was a history of rheumatism in only six; there is no mention of the frequency of sore throats or of other specific infections. The patients apparently had normal cardiovascular systems except that in ten there was high blood pressure and in four mitral stenosis. They were generally of the thin anxious type. The pain was worse after exertion, having no quantitative relation to it; in most cases it was a dull ache though a sharp stab was occasionally complained of. It was accentuated when the patient was tired. Exhaustion as in the present series was a prominent symptom; sighing and palpitation were frequent. Fainting was said to be unusual. The chief physical change was hyperaesthesia, which was present in 68 per cent.

individual produces no symptoms can in a more sensitive person give rise to severe pain. In the latter case the pain may be prominent when the underlying organic basis is so insignificant as to escape detection by any method of examination.

Three criteria have been used here for the diagnosis of *angina innocens*: first that the pain is not proportional to exercise; secondly, that there is no evidence of cardiovascular disease; and thirdly that the course of the disease in patients observed carefully proves its innocent nature. The absence of cardiovascular disease was demonstrated clinically, electrocardiographically and radiologically. The absence of any deleterious lesion is shown by the following facts with regard to twenty-one of the thirty-eight cases. Six of the patients have recovered four of these having been seen five years after the observed presence of the pain. Eight patients improved or were no worse after five years and one after three years. Seven were so young as to make it hardly possible that they could be suffering from coronary disease, their ages being 12, 15, 15, 16, 17, 17 and 20 years. This last patient of 20 in spite of attacks of pain had been for months in the habit of cycling distances of sixty to eighty miles each week end.

In order to give a wider view of the syndrome sixteen more cases with pain of an identical character have been added to the above twenty-one. They consist of eight cases in which the observed duration of the pain has been less than three years and eight of organic heart disease. The latter group is of particular interest: three patients with mitral disease have suffered from an *angina innocens* type of pain for five years; three with hyperpnoea have remained otherwise well for four years and one with hyperpnoea for three years. In the last case the pain was also associated with a microcytic anaemia and disappeared when this was treated. In the remaining patient the only sign of a cardiac lesion was a Q interval of 0.22 of a second. The fact that the latter patient has remained reasonably well and with no signs of failure in spite of organic heart disease is additional proof that this particular type of pain is innocent.

Methods of Examination

In all cases a full history was taken. In the past history the following points were specifically investigated: rheumatic fever, growing pains, chorea, scarlet fever, tonsillitis, diphtheria, syphilis and the history of the pregnancy. Note was also taken of other diseases or surgical operations. A history of previous mental stress or trouble was not recorded.

of cardiac dullness and the sounds were noted. Precordial hyperaesthesia was tested for in every case and the lungs and abdomen examined. An electrocardiograph was taken and in some cases repeated. The Wassermann test was done. A six foot film of the heart was taken, the contour of the heart noted and the heart-chest ratio measured.

Age and Sex Incidence

Of the thirty-eight patients who were examined twenty-two were females and sixteen males. The ages at which the syndrome manifested itself were as follows: of the twenty-two females eleven were between the ages of 36 and 46, ten of the sixteen males were between 41 and 55. Four males and five females were between 12 and 25 years of age. The youngest female was a girl of 15. In one case the onset was between the ages of 36 and 65.

Past History

In the past history two facts stand out. The first is the high incidence of rheumatic infections and tonsillitis and the second the frequency of psychological disorders. In twenty of the thirty-eight patients there was a rheumatic history: rheumatic fever occurred in seven, growing pains in twelve, chorea in two and scarlet fever in six. Twenty-one of the thirty-eight patients had had definite tonsillitis. In twelve of these the sore throat had been recent and in nine there was a history of sore throat in the past. In the latter group one patient had had sore throats for twenty years, two for twelve years and one until tonsillectomy at the age of 21. No quinsies were noted, the tonsillar inflammation being apparently more likely to run the course of the recurrent hyperemic type of inflammation found in acute rheumatism. No definite relation was found between an attack of tonsillitis and the onset of cardiac pain. Nor was there evidence that tonsillectomy relieved the pain. In one case angina innocens appeared immediately after an attack of rheumatic fever and persisted for eighteen months.

Sixteen of the thirty-eight cases had had definite psychological difficulties. Two had attended the Maudsley Hospital. Six had suffered from severe domestic worry and depression. Two complained of severe night terrors and nightmares. One had been a sleep walker and had been in the habit of diving off the end of his bed. One had had a functional hemiplegia and another functional dysphagia and dyspnoea. One had seen Sir Henry Head for psychasthenia and three had suffered from various phobias—syphilophobia, cardiophobia and agoraphobia. A history was obtained of the following diseases: syphilis, adequately treated in three cases; influenza in two; diphtheria, typhoid, paratyphoid, malaria, jaundice, diabetes, nephritis, asthma, epilepsy, mucous colitis and gonorrhoea—each in one case.

Symptoms

In addition to the precordial pain the other symptoms were as follows. Marked lassitude was complained of in thirty cases; this was the outstanding symptom apart from pain; it was severe and almost invariably more complained of than shortness of breath. If the question

'Which causes you the most trouble, tiredness or shortness of breath?' was put the answer would almost invariably be 'tiredness'. Shortness of breath of a not very pronounced degree occurred in twenty-nine cases. Orthopnoea was found in seven cases, one of them a case of mitral stenosis and one of hyperpnoea; in the other five the symptom was not prominent. Palpitation was complained of by twenty-nine patients. It was precordial in position, being generally felt over the apex but it

was not as a rule noticed at the base of the throat. It is often the case in paroxysmal tachycardia or in patients with hyperpnoea. Giddiness was a symptom in twenty-seven cases and faintness without loss of consciousness in seven. Thirteen patients gave a history of fainting in eleven of these the syncope immediately succeeded a sudden severe attack of left-sided precordial pain, generally radiating to the left arm. The details of this syndrome will be discussed later. It is thus apparent that twenty of the thirty-eight patients suffered from a somotor attack. Sudden painful stabs, possibly due to premature beats, were complained of by ten patients; a dull left-sided precordial ache often followed this.

Twenty-nine patients complained of a sense of constriction. This was generally left-sided and was not of the typical substernal central variety found in organic disease of the coronary vessels. A feeling of heaviness over the left praecordium was a commoner symptom than a sense of internal pressure or suffocation. Sighing, in spite of its frequency in patients with neurocirculatory ischaemia, had not been consciously noticed except by four patients, although it is probable that had careful respiratory tracings been taken the respiratory irregularity demonstrated in cases of neurocirculatory ischaemia by Paul White would probably have been found more often. Dyspepsia was present in fourteen cases and in several appeared to be a predisposing or trigger symptom for successful treatment of the dyspepsia generally led to considerable diminution in the severity of the cardiac pain. In no case, however, could it be said that the dyspepsia was the cause of the cardiac pain.

Syncope Type of Angina Innocens

The following cases are examples of a special syncope type of angina innocens in which the pain starts over the precordium or rarely in the mid line and radiates to the arm. The onset is almost always abrupt though most patients are able to reach a chair or a couch in time to sit down. The period of pain which is long enough to be remembered and to allow of the radiation to the arm to be noticed, is followed by an attack of fainting or faintness; the sharpness of the pain is believed by most of the patients to be the cause of the fainting attack. The loss of consciousness may not be complete. In several cases these syncope attacks were the first manifestations of the commoner type of angina innocens described above. Generally the attacks are somewhat infrequent but in one case amounted occasionally to ten a day.

In this patient the attacks had been spread over a period of six years and at the end of that time the heart was apparently perfectly normal.

A second patient was seized with a sudden attack of precordial pain while washing, became dizzy and half unconscious but managed to get back to bed. The pain in this case started in the left chest, radiated to the left arm and lasted for about half a minute.

The third patient was seized with an attack soon after rising and ascribed it to excitement at the prospect of seeing relations.

The fourth patient had four attacks in eight months; the attacks lasted for the unusually long period of ten to fifteen minutes before she lost consciousness; the onset was sudden and the pain started in the precordium and radiated through to the back. At this time the pain came on only with the syncope attacks although previously she had typical precordial pain after exercise. She had made a complete recovery when seen eleven months later.

The fifth patient had a severe sudden pain in the left chest radiating to the left axilla, not to the arm and then fainted.

The sixth patient had fainted two or three times but only in association with precordial pain which preceded the attack by a few seconds.

The seventh patient while getting her husband's breakfast had a sudden precordial pain which passed down the left arm and a sense of tightness in the throat. There was also a feeling of precordial constriction and she then fainted.

The eighth patient while stooping down to clean a stove was seized with a sudden severe attack of pain in the chest radiating to the left arm and felt very faint. Subsequently she had several similar attacks, one in church associated with

stenosis and in one mitral regurgitation. In one case a systolic murmur was heard at the apex and in another a systolic murmur which was loudest at the apex and conducted to the aortic base. No abnormality was discovered in the lungs. In thirty-seven cases the abdomen was normal but in one tenderness was present over the right renal area.

The blood pressure findings in this series of cases of angina innocens are worth careful attention. In thirty-one cases the recumbent systolic and diastolic pressures were normal. In five the blood pressure was subnormal; in two there was some hypertension which responded to dietetic treatment in one instance. In twenty-eight cases the blood pressure was taken with the patient in two positions after recumbency for five minutes and again after assumption of the erect posture for two or three minutes. In twenty-five of these patients there was a marked fall in the systolic pressure in the erect posture, which was associated as a rule with an increase in the heart rate. The average fall for the twenty-five cases was 21 mm Hg and this was accompanied by an average increase in the pulse rate of ten beats a minute. The maximum fall was 50 mm Hg but this was in a patient with hypertension. In three instances no change in the blood pressure or the pulse rate was observed in readings taken standing and lying. These findings are somewhat significant in view of the frequency of giddiness and fainting attacks in angina innocens.

Radiography disclosed abnormality in four cases and some slight prominence of the pulmonary conus in the patients with mitral stenosis. In none of these three was there any gross deviation from the normal. Two of the patients with left ventricular enlargement had hypertension. In twenty-nine cases the electrocardiographic tracing was normal; in eight there was some abnormality. These cases all showed left axis deviation which in five was physiological for the age of the patient. In no instance was there any abnormality of the T waves. In one case the tracing is lacking. The Wassermann reaction was negative in twenty-nine cases; in eight the blood was not examined and in one patient who had previously had a positive reaction the result was now negative.

Differential Diagnosis

The pain of angina of effort is characteristic and a careful history will in all cases differentiate the two.

in some degree, is not severe. Palpitation is prominent in angina innocens and was complained of by twenty nine out of the thirty nine patients whereas in only nine of those with angina of effort was this at all severe though three admitted to having suffered from it in a slight degree. Fainting or syncopal attacks strongly support the diagnosis of angina innocens, for none of the thirty seven patients with angina of effort suffered from these their only analogous symptom being in the case of hyperpetics, some temporary dizziness after stooping or on rising suddenly. Seventeen of the patients with angina innocens gave a history of fainting and none of those with angina of effort did so. Orthopnoea is a point in favour of angina of effort for twelve of the thirty seven patients complained of it in a marked degree and two slightly. Definite evidence of cardiovascular disease suggests angina of effort and in the complete absence of all clinical radiological and electrocardiographical evidence of organic cardiovascular disease angina innocens is the more likely diagnosis this is of course, not conclusive for a slight coronary lesion may obviously be present in a sensitive individual or in syphilitic aortitis and yet be physically undiagnosable. Mitral stenosis is an exception to the above rule for patients with this lesion when they suffer from cardiac pain complain of pain of the angina innocens type. The blood pressure in angina innocens is generally normal, subnormal, or shows a definite tendency to vary with posture that in angina of effort is frequently raised.

There should be no difficulty in distinguishing this condition from coronary thrombosis. The syncopal type of angina innocens, starting with a severe attack of precordial pain and followed by faintness or a syncopal attack may possibly suggest this diagnosis in some cases. There is however very rarely any loss of consciousness in coronary thrombosis. The absence of fever cardiac enlargement leucocytosis, and any electrocardiographic abnormality will confirm the diagnosis.

Picrosystolic tachycardia or auricular flutter may at the onset of an attack be associated with cardiac pain radiating to the arm and with faintness or fainting. Here a very high heart rate, which shows no variation from minute to minute, is characteristic. The electrocardiograph will again elench the diagnosis.

The syncopal type of angina innocens may suggest an epileptic attack with a visceral aura. The onset however is less abrupt than that of epilepsy. The patient generally has time to reach a chair or a couch before losing consciousness. There is a sufficient period to allow of the type of pain being recognized and later described. The tongue is not bitten. Convulsions do not occur. There is no incontinence of urine. The course of the disease is unlike that of epilepsy for there is no progressive increase in the severity of the symptoms. The patients on the other hand, generally show steady if slow improvement. (Since completing the above study I have seen a patient who suffered both from epilepsy and from angina innocens. In no instance were her attacks of epileptic unconsciousness associated with the presence or any exacerbation, of the cardiac pain.)

Other Types of Cardiac Pain

It is conceded that the pictures of angina of effort and of angina innocens are sufficiently distinct anyone with experience of patients with cardiac pain will agree that these two conditions do not account for all cases. Spasmodic angina is one condition in which a severe attack of cardiac pain arises. The exciting cause may be excessive anger, or possibly some digestive upset. The

characteristic of the attack is that when it has once started it has in the words of one patient "to run its course". It would appear as though the exercise or emotion started some definite pathological mechanism and that the pain persisted till such mechanism had ceased. The therapeutic action of amyl nitrite in these attacks suggests that spasmodic angina may be due to coronary spasm. The present investigation has as yet thrown no definite light on the mechanism of spasmodic angina but it has served to show clearly that there is such a symptom complex and that this can quite easily be recognized. More work is necessary before any deductions can be made as to why some patients with angina of effort also suffer from attacks of spasmodic angina or why a patient with angina innocens very occasionally appears also to suffer from these attacks. It would seem to be sufficient for the time being to analyse and to separate out the two clinical entities of angina of effort and angina innocens.

Possible Mechanism of the Pain

It is difficult to understand how the pain of angina innocens is produced. There is quite obviously no coronary disease. The severe spasmodic type of attack may just possibly be associated with some temporary coronary spasm but of this there is as yet no evidence. The known factors which may be concerned with the production of pain in these cases are worth enumerating. There is no doubt that the angina innocens type of pain is that found exclusively in those patients with mitral stenosis who suffer from cardiac pain. There may be some analogy between these cases of mitral stenosis and those with angina innocens and in apparently normal heart. In mitral stenosis the left ventricle is contracting in an abnormal manner. The diastolic filling of the chamber is probably somewhat reduced so that the systole tends to be over emphatic. The high pitched accentuated first sound and the slight but persistent diastolic murmur of tachycardia bear witness to this continuous cardiac over action. In these circumstances the patient's heart or praecordium may become gradually sensitive to the persistent knocking and the sensation may ultimately be magnified into pain.

A second factor is an over active central nervous system due to psychological or endocrine factors. The vasomotor system is also unduly labile. The falling of the blood pressure in the erect position the history of syncopal attacks and finally the curious association between a severe attack of pain and an almost immediate fainting attack all suggest this system may be at fault. A final factor the mechanism of which will remain obscure is the known association between chronic infection and irritable heart. In Dr. Coates' experience the infection was largely of a dysenteric nature but in the present series of cases it would appear to have been pharyngeal.

Prognosis

has persisted with remissions and relapses and is on the whole unchanged. One of this final group has had symptoms for twelve two for seven three for four to five years and two for two years. It is thus apparent that the prognosis is very good as regards life but it is also shown that the symptoms on the whole tend to be chronic. This chronicity when considered in conjunction with the absence of evidence of physical disease suggests very strongly that although there may be some slight physical basis the nervous or functional element preponderates. It is also clear that pain of this type has no bad prognostic significance, even if the patient is suffering from an organic cardiac lesion.

Conclusions

- 1 A cardiac pain of an anginal nature is described, the characteristics of which enable it to be differentiated as innocent. The term *angina innocens* is suggested.
- 2 The differentiation of *angina innocens* from other types of cardiac pain is described.
- 3 An account is given of a syncopal variety of the syndrome.
- 4 The prognosis as regards life is good but the duration of the pain with remissions is often protracted.
- 5 Factors possibly concerned in the production of the pain are discussed.

PREVENTION OF DISEASE IN INDUSTRY *

BY

DONALD HUNTER, M.D., F.R.C.P.

Physician with Charge of Out-patients, London Hospital

Industrial medicine is the practice of medical supervision, preventive medicine, and public health within the confines of an industry. Its aim is to safeguard the health of the employee and to minimize time lost from work because of sickness or of accidents. Though one of its functions is treatment it is mainly an advisory and preventive service. The industrial medical officer has to co-operate with managers, workers, engineers, chemists, and architects. He has to discover faults in the working environment and try to find remedies. One of his most interesting duties is to bring into the effective service of industry the discoveries of the research worker.

The Factory Department of the Home Office is constantly engaged in effective and progressive work for the prevention of disease in industry. It numbers on its staff men and women who are among the greatest living authorities on different aspects of industrial hygiene and toxicology. Their profound store of knowledge, constant helpfulness and unfailing courtesy industry sometimes fails to appreciate to the full. It is important that doctors should have the special knowledge and training which enables them to offer advice to the employer as to how his industry may be carried out in safety. At present with a few exceptions it is only the medical inspectors of factories who have this knowledge. No doubt with the growth of this branch of preventive medicine more doctors will make themselves competent in this interesting work.

The main principles underlying the prevention of disease in industry can be summarized under fifteen headings:

2 Medical Inspection Under State Support

In this country medical examination of entrants into industry required by law and carried out by certifying surgeons is very limited in extent and applies only to young persons between the ages of 14 and 16 but it was undoubtedly the forerunner of the much more extensive voluntary medical examination now frequently undertaken. An increasing number of employers are realizing the advantages of some kind of medical service in the factory. An additional measure of protection applied in many industries is the periodic medical examination of any workers exposed to known risks. This may be at weekly, fortnightly, monthly or quarterly intervals and may be carried out by the certifying surgeon or an appointed surgeon approved by the Chief Inspector. These examinations are chiefly undertaken in the case of work involving exposure to lead to carbon bisulphide to benzene and other tumes in india rubber works and to chronic acid in chromium plating. After the war a number of medical men were appointed to work as whole or part time works doctors with happy results but there is a need for the employment of a still greater number. They can often detect intoxication before disability is produced. Thus examination of the blood for punctate basophilia is of extreme value in the prophylaxis of plumbism and is indeed essential if the occurrence of manifest plumbism is to be avoided. Similarly in the earliest stages of benzene poisoning the platelet count and white cell count may fall and before tetrachlorethane poisoning appears elevation of the white cell count may be found. Facilities should be available for periodic medical examination and for repeated radiographs of the lungs in persons exposed to the risk of pneumoconiosis.

3 Prevention of Dust and Fume

Dangers from dust and fume may be removed by the application of local or general exhaust ventilation. As Sir Thomas Legge emphasized unless and until the employer has done everything—and everything means a good deal—the workman can do nothing to protect himself although he is naturally willing enough to do his share. Wherever possible exhaust ventilation through hoods must be applied at the point of origin of the dust or fume. It is in use in the manufacture of electric accumulators and of white lead in the manipulation of silica and asbestos and of carbon bisulphide and benzene in india rubber works. In certain instances general as opposed to local exhaust ventilation is applied. Good examples of this are the ventilation of dope rooms and of cellulose spraying shops where it is obviously impracticable to apply local exhausts direct to each doping bench or spraying horse. In dusty lead processes such as mixing and pasting in the manufacture of electric accumulators and the breaking down of the white lead stack the hose pipe must be freely used to reduce dust to a minimum. The breaking down of white lead stacks in a dry state must be forbidden and white lead should be converted direct into an oily pulp without dry grinding. The use of dry sandpaper for the removal of paint must be forbidden, and wet waterproofed sandpaper must be substituted. A preventive method which has been widely applied in the mining, metallurgical and ceramic industries is the substitution of wet methods for the original dry screening grinding milling and mining processes. Dry drilling is the cause of most of the dustiness in mining and while wet drilling does not ensure a dust free atmosphere it reduces dustiness very considerably. In the grinding industries where sandstone wheels are used there should

be a continuous stream of water running over them. In dusty trades respirators should be used where possible, but it is usually difficult to get the men to wear them.

4 Protective Apparatus Uncontrollable by the Workman

Sir Thomas Legge used to emphasize that in the prevention of disease in industry, if you can bring an influence to bear external to the workman—that is one over which he can exercise no control—you will be successful and if you cannot or do not you will never be wholly successful. In the case of exhaust ventilation it is usually a simple matter to have the machinery operating the fans outside the workshop altogether. Even so, the protective apparatus may not be fool-proof as in the case of the workman in a grinding shop who can turn back the hood from his grinding wheel for use as a receptacle for tools thus making the whole apparatus ineffective.

5 Education of Workman as to Nature of Danger

Sir Thomas Legge used to insist that all workmen should be told something of the danger of the material with which they come into contact and not be left to find it out for themselves sometimes at the cost of their lives. The factory physician should insist on the necessity of teaching the workman to take an interest in protecting himself. He should be taught the importance of clean habits in lead works and should be made to understand such things as the principles of dust suppression. For example he should know that a vacuum cleaner is used to remove dust from a workshop for his protection and should therefore never be employed with the motor reversed. Cautionary placards and illustrated notices should be used in the workrooms concerned so that the early lesions of the skin in anthrax and in chrome ulceration are familiar to all. To ensure the prompt treatment of anthrax an individual card has been devised for workers employed in industries exposing them to risk. In case of illness this is presented to the doctor as a hint that the possibility of anthrax should be considered. It is of vital importance to train men in safe methods of artificial respiration so that these can be employed promptly in cases of carbon monoxide poisoning. The factory physician must never agree to a scheme where the workmen are kept ignorant of the poisonous nature of substances handled. In the war American workmen were told that trinitrotoluene might indeed explode but was otherwise harmless. This attitude was a distressing obstacle to those who tried to introduce into American plants the safeguards which had been successfully adopted in this country.

6 Cleanliness of Work Places

In some dangerous trades constant vigilance by a staff of good foremen is necessary. In the manufacture of trinitrotoluene absorption through the skin cannot be prevented unless benches tools floors and walls are kept spotlessly clean. Similarly glaze rooms and dipping rooms in the potteries accumulator pasting shops and all rooms in which a dusty lead process is carried on must be wet-cleaned every night to prevent the inhalation of dust of compounds of lead. Where it is impracticable to use a wet process—as for example in the manufacture of litharge—the foremen must see that no dust is raised in shovelling.

7—Bodily Cleanliness

Cloakrooms washing rooms messrooms baths nail-brushes towels and soap must be provided by the employer and used in their time. Where absorption is known to occur through the skin as in the use of aniline,

nitrobenzene and trinitrotoluene appropriate protective clothing must be worn. If direct contact with the poison cannot be avoided every means must be adopted to protect the skin. The surface which is necessarily exposed may be covered with a bland ointment, dusted with powder or washed frequently. There is a risk in too much washing of the skin and care must be taken in such cases to use the least irritating cleansers to avoid scrubbing and to replace the lost oils of the skin byunction with an animal fat.

8 — General Hygiene

There are certain principles which apply to all trades but are of greater importance in the dangerous trades because to neglect them may increase the susceptibility of the worker to the poisons concerned. Measures must be taken to prevent long hours of work, the employment of boys and girls, undue heat from furnaces and steam from tanks, and the use of underground workshops and bad lighting and ventilation. In this country the law requires that every factory and workshop shall be kept clean and free from effluvia, provided with sufficient means of ventilation, and kept at a reasonable temperature. It does not however contain any provisions as regards lighting. If domestic conditions were always of the standard required by law for a factory or workshop the health of the general population would certainly be improved. It is not suggested that the conditions existing in every factory or workshop in this country are by any means perfect but in the majority a good standard has been attained. During the war it was realized that hygienic surroundings, good ventilation and lighting facilities for obtaining food at a reasonable cost and opportunity for rest and recreation were not only good for the worker but to the advantage of the employer. The benefits derived from such improvements have served to stimulate the provision of further facilities for workers to enjoy a healthy life. Except in the special rooms set aside for the purpose, smoking, eating and drinking must be forbidden in certain works—for example, lead works. Otherwise a man might carry a compound of lead on his fingers to his cigarette and perhaps inhale a dangerous amount.

9 Improvements by Chemists

naphtha and acetone. Further work is required to find for example a harmless substitute for nitrate of mercury in the felting of fur.

10 -Improvements by Engineers

Wherever possible mechanical means should be substituted for hand carriage. Examples of this are seen in the use of cranes, rails, hoists travelling belt covered conveyors and hoppers and automatic packing machinery. The abolition of hand filling of shells, the substitution of shot blasting for sand blasting and of stainless steel for chromium plating and the use of a closed in film steam evaporator in the manufacture of silver nitrate are further examples. The invention of electroplating about 1840 led to a great diminution in the number of cases of mercury poisoning because it replaced water gilding in which mercury was volatilized from an amalgam by heat over a fire. An outstanding contribution to the reduction of the risk of lead poisoning was the invention of the wet pulping method in the manufacture of white lead 90 per cent of the white lead manufactured in this country is never handled in the dry state but is converted from an aqueous pulp to an oily paste in closed machines. Glass workers' cataract has been minimized by the invention of a glass bottle making machine producing bottles at the rate of forty a minute and at one ninth the original labour cost. In iron and steel rolling mills the use of goggles made of Crookes glass protects the eyes from the fire, heat and glare, and so prevents cataract.

11 Knowledge as to Portals of Entry of Toxic Substances -

Where it is known by what route—respiratory, alimentary or cutaneous—a poison is absorbed the physician can in consultation with the employer indicate on what principles the methods of protection should be based. In the majority of industries absorption through the respiratory tract is of overwhelming importance. Except very rarely lead poisoning is not due to eating with unwashed hands. In a few industries absorption through the skin may take place—for example in the handling of aniline, nitrobenzene, trinitrotoluene, nicotine and lead tetra-ethyl. The mechanical details which render the workers in a given industry safe from toxic substances must be settled in consultation with engineer.

smelting and in processes involving exposure to carbon bisulphide, nitrobenzene and trinitrotoluene short shifts must be enforced. Hours of work must be limited for men working in compressed air or in hot deep mines. The factory physician must make use of all known methods to detect the earliest onset of poisoning by substances such as lead, benzene and tetrachlorethane.

14—Selection of Immune Persons

Employment of women and of all persons under the age of 18 in certain lead trades must be forbidden. In gasworks and on blast furnaces where there is a danger of carbon monoxide poisoning it is better to employ middle-aged men who are partially protected by their lesser physical activity and slower respiration. The selection and employment of only immune persons is an ideal the attainment of which must wait on better knowledge. If research could produce satisfactory tests for immunity to various poisons a great deal of suffering and expense could automatically be abolished.

15—Further Researches

It would be idle to suppose that our knowledge of industrial diseases is a finished chapter. Many diseases of occupational origin remain unknown for years, notable instances being asbestosis and Weil's disease. Clearly there must be others still eluding our search. New processes are constantly springing up. In some countries new solvents for quick-drying paints and varnishes have been allowed to poison men whereas they should have been first tested on experimental animals. A new method of tin refining recently produced outbreaks of arseniuretted hydrogen poisoning under circumstances which should have been condemned beforehand by chemists since it is known that the action of water on metallic arsenides is to set free this deadly gas. Until 1933 the co-operation of geologists in attacking the problem of pneumoconiosis had not been sought. The petrological microscope rapidly incriminated silicates such as sericite and sillimanite whereas previously silica had been held solely responsible. Recently fluorosis of bones a new horror of industrial medicine was unearthed. Is this condition widespread among cryolite crushers elsewhere than in Denmark? Do bath enamellers suffer from it? What, if any will be the ultimate consequences to bone and bone marrow of the deposition of calcium fluoride in the skeleton? Is the high incidence of malignant disease of the nasal sinuses in workers in nickel related to substances used in their work, and is there also a high incidence of lung carcinoma among them? Will the chemist find a suitable substitute for nitrate of mercury in the felting of fur? Will the bacteriologist succeed in producing effective inoculation against Weil's disease? What is to be done about Raynaud's phenomenon produced by the use of vibrating tools, including pneumatic drills, rams chisels, and riveting machines? Will the phenomenon hitherto confined to women become equally common in men? These and many other problems await solution. We are on the right path but we have a long way to go.

The King Edward's Hospital Fund for London has made arrangements for Coronation tours of royal palaces and other historical buildings famous throughout the Empire. These privileged visits will take place on April 7, 10, 14, 21 and 28, May 19 and 28. Tickets are 10s each or £2 10s for the series and the entire proceeds are devoted to the Fund. Communications should be addressed to the secretary, King Edward's Hospital Fund for London, 10, Old Jewry, E.C. 2.

EPIDEMIC CATARRHAL JAUNDICE IN SCHOOL CHILDREN

BY

ARTHUR A. LISNEY, M.A., M.B., D.P.H.

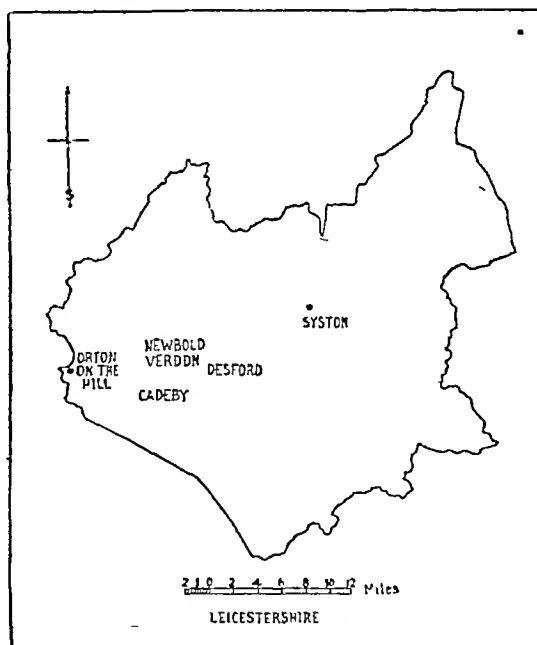

Assistant Medical Officer of Health and Senior Assistant School Medical Officer, Leicestershire County Council

Towards the end of 1936 an outbreak of jaundice occurred in Leicestershire the villages of Newbold Verdon, Desford and Syston being chiefly affected. The epidemic was mild and no deaths resulted. Altogether forty school children suffered from the disease, and it is estimated that this figure represents 60 to 70 per cent of the total number of cases pre-school children and young adults being also affected.

The first intimation of the outbreak came from Newbold Verdon when the head teacher of the local school reported in November that five children were absent suffering from jaundice. It was decided that I should undertake a special investigation in order to ascertain whether or not the disease was caused by the *Leptospira icterohaemorrhagiae*.

Nomenclature

Epidemics of jaundice have been recorded since ancient times and have occurred at one time or another in every part of the world. No attempt at classification was made until Weil (1886) published an account of the symptoms in a number of severe cases.

Map showing the relative position of the villages where cases of epidemic catarrhal jaundice occurred

Cockayne (1912) went a step further and differentiated between Weil's disease and the milder type by styling the former infectious jaundice and the latter 'epidemic catarrhal jaundice'. This classification was commonly used until Hurst and Simpson (1934) produced definite evidence that there were in reality two forms of the milder jaundice and distinguished the infective hepatic type from the epidemic catarrhal.

In November 1914 Inada and Ido discovered that the organism responsible for Weil's disease or infectious jaundice

dice was the *Leptospira icterohaemorrhagiae*. All attempts to isolate the organism or organisms causing the other types of jaundice have so far failed.

Historical Review

Outbreaks of epidemic catarrhal jaundice are not infrequent in this country. Morgan and Brown (1927) described an extensive outbreak in the Midlands in which two hundred persons were affected and one fatality occurred. Particulars of an epidemic in Surrey were published by Booth in 1928. Two years later Pickles, outlining an outbreak of catarrhal jaundice in Yorkshire, states that in many ways it resembled the Surrey epidemic. Findlay, Dunlop, and Brown (1931) published an account of numerous small outbreaks of jaundice occurring during the two previous years in Surrey and particularly affecting elementary school children. During the same year Glover gave an account of an outbreak in an unnamed small country town in which are situated three boarding schools, all of which were affected. In 1934 Bishford published an account of an outbreak of epidemic catarrhal jaundice among the workers in several departments of the General Post Office in London.

Montford (1934) describes an epidemic in the Castle Donington district of Leicestershire in which forty five cases were identified as acute infective jaundice, all except two being children. Frazer (1935) in reporting the occurrence of epidemic catarrhal jaundice among children in Staffordshire states that the outbreak was of a similar nature to that which occurred during the previous year at Castle Donington which is about fifteen miles distant.

There appears to be some uncertainty with regard to the classification of these two last mentioned epidemics as Barber (1937) classifies both of them as infective hepatic jaundice.

Ramage (1935) describes an outbreak of epidemic catarrhal jaundice in Holland, Lincolnshire, and estimated that 80 per cent of the cases occurred among school children.

Incidence

The present investigation was confined to the outbreak of jaundice among school children, though as mentioned above this figure represents about 65 per cent of the total number of cases as pre-school children and adults also contracted the disease, particularly young adults between the ages of 16 and 25.

The distribution of the cases was as follows:

District	Village	Population	Number of Cases (49) Investigated
Market Bosworth R.D.	Newbold Verdon	1,251	21
Market Bosworth R.D.	Desford	432	7
Market Bosworth R.D.	Donington	1,163	4
"	Causton	12	2
"	Oulton	191	1

As this epidemic occurred in the autumn and winter months the seasonal incidence corresponds with that recorded in the majority of similar outbreaks.

It is also interesting to note that the age and sex incidence as shown below agrees with the findings in previous investigations in that it is evenly distributed between the sexes and the highest incidence occurs in children between the ages of 6 and 10.

Age	Males	Females
0-5	2	
6-10	14	15
10-15	3	3
	19	21

Aetiology

Every effort was made in an endeavour to ascertain the mode of spread of the disease.

Attention was first directed to the water and milk supplies in the villages concerned. Excepting Desford and Syston each of which has a main water system, it was found that the sources of water supply were multiple, there being a large number of pumps each supplying one or more houses. The children have of course common access to the water supply at the school which they attend, but this fact was not helpful as all the children in any one of the villages affected did not attend the same school. The sources of milk supply were equally varied and thus no evidence was found of a likelihood that the disease was transmitted by either of these two routes.

The question of infection spreading by means of rats was also considered, but here again no definite evidence was forthcoming. During the past few years the villages have been comparatively free from these vermin, there fore any contamination of food is unlikely.

On investigating the spread among the school children several interesting facts came to light. With few exceptions the children who developed the disease gave a history of having been in close contact with other children who either had the disease at the time or developed it shortly afterwards. The contact was in most cases either a relative or another child habitually sitting in the next seat at school.

Although all those in contact with a case did not develop the disease it would appear that a very close personal contact is necessary for the spread of epidemic catarrhal jaundice and whatever the causal organism it is no doubt transmitted by droplet infection. It would also seem almost certain that a child was infectious during the incubation period of the disease.

It was difficult to determine the probable incubation period and although in Newbold Verdon the cases tended to occur in batches with three day to five day intervals between them little can be deduced from this fact. In several instances where two children in the same family were affected there was approximately a month between the dates of the first symptoms in each case and it is quite reasonable to assume that the second victim contracted the disease from the first. On summarizing the length of time between the date of the first symptom and the alleged contact with the disease it is found in the forty cases under observation that this period more nearly approaches four weeks than one week.

The distribution of the epidemic in the county is at first difficult to account for, there being no direct communication between the villages concerned with the exception of Newbold Verdon and Desford. Investigation, however, disclosed the fact that a number of young adults from the villages work in factories some distant away. It was also learnt that cases of jaundice had occurred among the factory workers and indeed the epidemic probably originated through this channel from an extraneous source.

Clinical History

The clinical history of the disease is rather uncharacteristic, though the course is usually

the severity. In one instance symptoms were completely absent until jaundice appeared.

The onset was gradual and for several days before definite symptoms developed the child complained of a headache with perhaps nausea, loss of appetite, and a feeling of lassitude and sleepiness. At this stage the tongue was usually covered with a slight fur and the breath fetid. In most cases bradycardia could be detected, while in some the face was flushed, though the temperature was found to be normal. Diarrhoea was sometimes present but constipation was more usual. Vomiting which is the first definite symptom then occurs and varies in severity, some children only vomiting once while others continued for an hour or more. This vomiting has been attributed by some writers to a duodenitis. Pain in the upper abdomen accompanied the vomiting in several instances being so severe that the parents thought the child had appendicitis. The pain diminished as the vomiting subsided, but a slight tenderness on palpation persisted for some days over the region of the gall-bladder, which was palpable in several cases. There appeared to be a correlation between the rise in temperature and the severity of the disease, for in those cases which were febrile the symptoms were more marked.

From one to fourteen days after the acute symptoms developed jaundice appeared and the child at once began to feel better. At first the conjunctivae were affected, then the skin of the face, neck, arms, trunk and lower limbs became yellow. In some instances the jaundice was less intense and did not spread beyond the eyes or face, while in others it was very intense and the patient exhibited the peculiar orange flush of the face that has been described in previous epidemics. About the same time as jaundice appeared the faeces became pale and the urine dark, though an occasional dark bile stained stool was passed. Itching of the skin was only present in those children where the jaundice was widespread and deep in colour. Convalescence was complete in about a fortnight and no complications occurred.

The chief symptoms in order of frequency in the forty cases investigated are here summarized.

	occurred in 40 cases
Jaundice	40
Faeces pale	40
Urine dark	40
Vomiting	36
Pain in the epigastrium	34
Loss of appetite	34
Lassitude	34
Sleepiness	31
Headache	30
Dizziness	21
Temperature	18
Rambling	17
Itching	12
Diarrhoea	8
Sore throat	1 case

Laboratory Investigation

Investigation under this heading was undertaken by the Leicester City and county laboratories. The following is a summary of the specimens submitted for examination, and the findings.

Blood—Specimens of blood were taken from two cases each on the sixth day of the disease. On microscopical examination of the centrifuged deposit no spirochaetes were detected. Another specimen taken from a case on the forty-ninth day after the first symptoms developed was also submitted and the serum tested for agglutination against the following proved negative in all dilutions: *B. typhosus* H and O, *B. paratyphosus* A and B, *B. dysenteriae* Sonne, *B. dysenteriae* Shiga, *B. dysenteriae* Flexner, *B. aertryche* and *B. abortus* Bang. Blood films were taken at various stages of the disease from all the forty cases investigated

and a differential count made. A number of the films showed an eosinophilia sometimes as high as 15 per cent but as this high count is frequent in routine films taken from country children where the cause is usually threadworms no significance is attached to the present findings. In the majority of the films however a monocytosis was evident, varying from 2 to 19 per cent while in a number of others taken from contacts who did not develop the disease the monocytic counts were normal.

Urine—Altogether twelve specimens of urine were examined for spirochaetes where the period of the disease varied from the seventh to the thirty-third day. A centrifuged deposit from 15 ccm of urine was injected peritoneally into two series of guinea pigs all of which survived three weeks. In addition the specimens of urine which were deeply bile stained were examined microscopically. An occasional leucine crystal was present in one specimen but the others showed no leucine or tyrosine crystals, red blood corpuscles or casts. No spirochaetes were found in any centrifuged deposit.

Faeces—A specimen from a typical case was collected in the acute stage and submitted for examination for any abnormal bacteria. The result was negative.

In my opinion the above results can be accepted as definite evidence against the epidemic being either of spirochaetal origin or due to any of the other possible organisms for which tests were carried out.

Differential Diagnosis

Weil's Disease (*Spirochaetosis icterohaemorrhagica*)—Weil (1886) was the first to publish an account of this disease. Since then a number of similar outbreaks have been described and referred to as Weil's disease but it was not until 1914 that the disease as described by him became definitely linked with the *Leptospira icterohaemorrhagiae*. In November of that year two Japanese workers Inada and Ido inoculated a guinea-pig with blood from a patient suffering from the symptoms of Weil's disease and subsequently discovered the spirochaete in the animal's liver. Since then a good deal of work has been done in various epidemics notably that by Dr Adrian Stokes during the great war who proved that rats carried the organism. Many outbreaks of spirochaetal jaundice have occurred on the Continent and in Asia. With regard to this country outbreaks of Weil's disease are very rare. Buchanan and Gulland (1923) report the finding of the spirochaete in the blood and urine of miners in East Lothian who were suffering from jaundice. Since then other small outbreaks in Scotland and England have been reported. The onset of the disease is sudden and is ushered in with general malaise, severe headache, violent muscular pains, giddiness, loss of appetite, high fever, epistaxis and usually diarrhoea. The symptoms become more acute as the disease progresses, and nervous disturbances increase, delirium frequently being present. From about the third to the fifth day jaundice appears and is accompanied by enlargement of the spleen and liver and tenderness over the latter organ. The urine contains albumin and perhaps blood. Disturbances of the digestive system are marked, there being furred tongue, vomiting and abdominal pain. The temperature falls about the twelfth day and the jaundice begins to fade about the same time. Convalescence is slow and leaves the patient weak and exhausted. The death rate is relatively high and has been estimated in one epidemic even as high as 45 per cent. The *Leptospira icterohaemorrhagiae* can be isolated and identified microscopically in a centrifuged deposit of the blood taken about the third day of the disease in a similar deposit of the urine in the later stages or by animal inoculation with the same material and subsequent recovery of the organism from the liver and spleen. The above are the

usual symptoms that occur, but some variation in type and severity has been noticed in several of the epidemics described.

Infective Hepatic Jaundice—Hurst and Simpson (1934) showed conclusively that this type differed from the closely allied epidemic catarrhal jaundice. Several epidemics are classified under this heading by Barber (1937) particularly those recorded by Montford (1934) in Leicestershire and Richards (1933) in Derbyshire. The clinical picture is quite distinct from that in either Weil's disease or epidemic catarrhal jaundice. Usually there are no pre-icteric symptoms of any kind. Pale faeces and dark urine occur immediately prior to the appearance of jaundice, which is accompanied by headache, general malaise, occasional vomiting, diarrhoea and a slight rise in temperature. The liver and spleen are enlarged though epigastric tenderness is absent. The jaundice is less marked but of longer duration than that of epidemic catarrhal jaundice. Convalescence is prolonged and the patient is left very weak. The mortality rate though low, is higher than that in epidemic catarrhal jaundice. Appropriate tests disclose an hepatic insufficiency and in the few post-mortem examinations described hepatic necrosis was present.

Simple Catarrhal Jaundice—Usually of a very mild character and due to a mechanical obstruction of the biliary passages said to be due to colds, chills etc. and often occurs in children. The symptoms of this type and of epidemic catarrhal jaundice are very similar and it is often difficult to differentiate between the two. Owing to the absence of bile the stools in simple catarrhal jaundice are pale and remain so until obstruction to the bile flow is removed. In the epidemic type although the stools are for the most part pale, an occasional bile stained stool is passed.

Enteric Group—Jaundice rarely occurs in this group of fevers and although the symptoms resemble in some respects those in epidemic jaundice the agglutination tests and bacteriological examination of the excreta reveal the presence of the organisms belonging to this group.

Acute Yellow Atrophy of the Liver—Of very rare occurrence particularly in children. The post-mortem findings are somewhat similar to those in infective hepatic jaundice.

Treatment

All the cases which occurred in this epidemic were under the care of the local general practitioners and treatment chiefly consisted of confinement to bed for a few days and the relief of symptoms.

It was not considered desirable or necessary to close any of the schools involved. These children who had been in contact with the disease, also the senior children from the affected villages attending central school, were however excluded for several weeks, and it was impressed upon the parents of the former to keep them in strict isolation during the period away from school. The parents of children who had contracted the disease were advised to prevent them mixing with other children until convalescence was complete.

3 There was no evidence that the disease was spread through the medium of water or milk supplies or by rats.

4 It is evident that epidemic catarrhal jaundice is spread by close personal contact, probably by means of droplet infection.

5 The incubation period is about four weeks and children with the disease appear to be infective during this stage.

6 No causal organism was found, though undoubtedly it exists probably in the form of a virus as suggested in previous epidemics.

I am indebted to Dr J. A. Fairer, county medical officer of health for permission to publish the particulars of this investigation.

EXTERNAL VERSION FOR BREECH PRESENTATIONS *

BY

CHAMANIA MEHIA, M.B., B.S. BOM.,
I.R.F.P.S. Glas

Obstetrician and Gynaecologist, Bhagat Hospital for Women, Bombay.

Compared with vertex presentations the incidence of breech presentations is low but the foetal mortality is high. Pierson (1923), Westman (1931), Dearnley (1931), Studdiford (1932), Geothals (1936) and Williams (1924) placed the incidence of breech deliveries between 2.3 and 3.7 per cent. Kedar Nath Das (1926) placed it at 3.3 per cent and the latest report of the Wadia Hospital (1935) at Bombay gave it as 3.1 per cent. Ryder (1923), Pierson (1923), King and Glidden (1929), Githberd (1931), Studdiford (1932), Morton (1932), Donovan (1933), Cannell and Dodel (1934), Gordon, Garlick and Oguz (1934), Burn (1934), Geothals (1936) and St. Mary's Hospital report for 1935 record the foetal mortality as varying from 5 to 26 per cent in complicated and premature breech presentations it was as high as 43 per cent and 48.6 per cent.

Scope of Investigation

Desiring to find out the state of affairs at the Bhagat Hospital for Women and at my private hospital I have reviewed 5028 deliveries—3628 from my private hospital and 2000 from the Bhagat Hospital.

In the first 1240 deliveries at my hospital and 2120 at the Bhagat Hospital the incidence of breech presentations

as a therapeutic measure for complications such as placenta praevia are excluded from both the groups, and only those who were under observation for some weeks before labour are considered

Breech Presentations in 5028 Deliveries

The average weight of the children born in the two hospitals was 5 lb 14 oz. the incidence of breech presentations in the whole series was 1.9 per cent.

Untreated Cases

In the first group of 3240 deliveries in which breech presentations were not interfered with during pregnancy eighty-eight women were confined as breech deliveries giving an incidence of 2.7 per cent and the foetal mortality in these cases was 37.5 per cent—twenty-two infants were stillborn and eleven died during the first ten days of the puerperium. The standard for deciding prematurity was not based on the gestation period counted from the first day of the last menstruation because this was found to be very unreliable. A foetus weighing 5 lb and over was taken as mature and one below 5 lb as premature. This proved more satisfactory. The average weight of the children at the two hospitals under review has been 5 lb 14 oz.

On this standard we found fifty-three mature and thirty-

livery in Group I, with the average weight of 6 lb 3 oz and 3 lb 8½ oz respectively. Foetal mortality in the mature was 13.2 per cent and in the premature 74.3 per cent. The average weight of the dead was 4 lb 10 oz. Of the eighty-eight breech presentations in the group twenty-one were in primiparae, with a foetal mortality of 33.3 per cent and sixty-seven in multiparae with a foetal mortality of 38.8 per cent. Among the primiparae seventeen (81 per cent) were mature and four (19 per cent) were premature—three of the mature were stillborn and two stillbirths and two deaths occurred in the premature children. The average weight of the dead in the mature was 6 lb 8½ oz while in the premature infants it was 3 lb 8½ oz. The average age of the primiparae was 19.65 years. The average external pelvic measurements were interspinous 21.4 cm, intercrystal 23.4 cm and external conjugate 17 cm.

Of the sixty-seven children born of multiparae thirty-six were mature and thirty-one (46.3 per cent) premature with an average weight of 6 lb 2 oz and 3 lb 8 oz respectively. The foetal mortality was 11 per cent in the mature and 71 per cent in the premature. The average weight in the dead was 3 lb 7 oz. There were seventeen stillbirths and nine infants died during the first ten days after birth, three stillbirths and one death occurred in the mature and fourteen stillbirths and eight deaths in the premature.

Foetal Mortality

The heavy foetal mortality in breech presentations has always worried obstetricians. In endeavouring to reduce it various factors have been blamed and a number of suggestions made. Gentleness, patience, episiotomy, sacral anaesthesia, preliminary ironing of the vagina, forceps for the after-coming head, and many other suggestions have been made by different writers. In spite of all this the lowest figure for the foetal mortality in breech presentations has remained higher than that in vertex presentations.

In Cleveland Maternity Hospital Barney (1934) found a foetal mortality of 18.9 per cent in breech cases excluding prematurity. Hirst and Williams have advised external version, as have Ryder (1923), King and Gladden (1929), Wilson (1930), Gibberd (1931), Studdiford (1932), Dearnley (1931), Donovan (1933), Cannell and Dodek (1934), Munro Kerr (1933), and Aleck Bourne (1933). In the last 1788 consecutive deliveries at my hospital all cases of breech presentation diagnosed during the later months of pregnancy were carefully kept under observation. The practice at the hospital has been to register the patients for confinements about twelve weeks before term, and they are made to report frequently for observation. A breech presentation was diagnosed in 110 cases but only eleven of them became breech deliveries—that is 0.6 per cent. It was a coincidence that in exactly fifty-five cases the breech either turned to vertex naturally while under observation or confined as breech before it was decided to perform external version. The remaining fifty-five cases were treated by external version during pregnancy.

Results of External Version

The total number of breech deliveries in Group II was eleven—nine among the non-treated and only two in the treated cases. The foetal mortality in the series of 110 cases was five (4.54 per cent) and all the deaths were in the non-treated cases. Of the five four were stillborn and one died during the first ten days. The average weight of the dead was 3 lb 14½ oz. There was no mortality in

ality of 37.5 per cent in Group I should be compared with that of 4.54 per cent in Group II with no mortality in the cases treated by external version.

Prematurity

The number of premature infants in this group was sixteen of which twelve were in the non-treated group. This represents 14.5 per cent as compared with 39.6 per cent in Group I. What is the reason for such a fall in the number of premature labours? Is it due to the improvement of the general health of the patients as a result of ante-natal care or is it that the breech presentation has a tendency to bring on premature labour? If the latter hypothesis can stand critical examination then the belief that prematurity is an aetiological factor in breech presentation will need to be reconsidered. It was frequently noticed that patients with the foetus lying in the breech position complained of vague pains in the abdomen and were more uncomfortable than those with the foetus lying normally in the vertex position. Is it possible that the breech position irritates the uterus in some way and if this is the case is such irritation likely to initiate uterine contractions prematurely?

Among the non-treated cases of this group forty-six were confined as vertex presentations and nine as breech. Of the five deaths in the children there were three in the breech deliveries and two in the vertex. Of the fifty-five cases in which external version was performed forty-seven were multiparae and eight were primiparae. Version was successful in fifty-three and failed in two. There were fifty-one mature and only four premature infants. The number of premature births was thus one-fourth of those found in the non-treated cases and far below that of Group I. There was no foetal mortality among these treated cases. Of the two failed cases one was a primipara 17 years old who came under observation only five days before delivery with the breech fixed in the pelvis; external version though tried could not be performed. The second case was a multipara diagnosed as a breech presentation on September 21; external version was tried on October 1. She did not report again and came to the hospital in labour on October 16; a female child weighing 4½ lb was delivered by the breech.

Many foetuses diagnosed as breech presentations during pregnancy turn to a vertex position before term just as many do not turn naturally. This is seen from the comparison of the results of the two groups reviewed. The incidence in Group I was 2.7 per cent while in Group II it was 0.6 per cent. Thus 2.1 per cent failed to turn

difficult to perform version again. Anaesthesia was never found necessary in the series reported. It might be required and might be of help if the operation was postponed to the later weeks. Most authors are in favour of turning the child during the thirty-fourth or thirty-fifth weeks. Aleck Bourne (1933) and others advised it at the thirty-sixth week. Two weeks earlier than this has to my mind an advantage in the ease with which manipulations can be carried out particularly in primiparae.

Possible Dangers

The early onset of labour and separation of the placenta and consequent ante-partum haemorrhage have been mentioned as possible dangers of version. Rider (1923) had one case of bleeding per vaginam and premature labour but with no untoward consequence. Wrigley (1934) criticizing ante-natal work, observed that in two London obstetric hospitals where external version is performed under anaesthesia the manipulations had caused rupture of membranes in some cases and in one the cord prolapsed while in three there was brisk ante-partum haemorrhage. Foetal deaths were caused by asphyxia owing to detachment of the placenta and constriction of the umbilical cord as a direct result of a somewhat violent effort to turn the baby. He observed that external cephalic version under anaesthesia must be regarded as a manipulation that was not free from danger and must not be performed with any force. McCullough (1933) besides the complications already mentioned suggested a possible danger of rupture of the uterus at the time of labour subsequent to the version, particularly in breech with extended legs. He collected four cases of this kind from the literature and therefore advised x-ray examinations before and after version concluding that if the child presented by head and feet it should be turned again and delivered by the breech.

Aleck Bourne (1933) maintained that the risks of version were counterbalanced by greater safety to the woman and far greater safety to the child. Munro Kerr (1933) advised that all breech presentations should be corrected to vertex. Studdiford (1932) believed that the operation of version was harmless but quoted Lister as stating that anaesthesia was dangerous. Rider (1923) was enthusiastic about the good results of external version. He pointed out that by doing an external version one was able to judge the size of the pelvis and the risk was that as undue force might be applied.

In our cases no anaesthesia is used in any patient in whom anaesthesia might have been of use; the presentation was allowed to continue as a breech. If version is

her pain. She was asked to go on taking gradual deep breaths followed by complete expiration. This allowed the operator's fingers good access down into the pelvic cavity. The breech was taken out of the pelvis and into the superior strait. Once this was accomplished the rest was not difficult. The breech was pushed out and up towards the back of the foetus and the head in and down towards the child's abdomen. A few movements like this were necessary to get the head into the iliac fossa. Then the patient was asked to turn a little to the side opposite to that in which the back of the foetus was lying. When this was done the head was pushed inwards and downwards and the breech lifted upwards. The head was felt passing over the brim into the pelvic inlet. The dorsal position was then resumed and the head was gripped between the fingers and pushed down into the pelvic cavity. This last manoeuvre gave us an idea of the size of the pelvis. Once the head was in the pelvis the version was complete. Occasionally it was necessary to push the breech towards the child's abdomen and the head towards its back, the child turning by anti-clockwise movement. Pushing out the breech from the pelvic cavity by the help of fingers introduced in the vagina was also occasionally required. No binder or any other appliance was found necessary to maintain the vertex position.

The patient was asked to report two days later and was kept under observation subsequently. If at any later visit reversal to a breech position was noticed another attempt at cephalic version was made. More than two attempts were never found necessary and that too in a very small number of cases. We did not meet with any untoward complications due to the manipulations.

I cannot conclude without expressing my thanks to my house surgeons Drs. Jhaveri and Shah.

A special tour in Central Europe has been arranged for May 23 to June 10 in connexion with the meeting at Bucarest of the Permanent Committee of the International Congress of Military Medicine and Pharmacy. Leaving Paris on May 23 at 10.15 p.m. the places to be visited include Venice, Dubrovnik, Cettigne, Serajevo, Belgrade, Turnu Severin, and seven days in Bucarest. The fee of £61 10s covers all travel expenses from Paris to Bucarest and back with second-class rail travel with Wagons lits and first-class passages on river boats and various excursions on the way. An alternative return journey through Budapest and Vienna, extending over June 10 to 16, can be made for £7. For further details and for booking application should be made to Gellatly, Hanley and Co. Ltd. 62 Pall Mall London SW 1 or at the offices of this firm in Manchester, Liverpool or Glasgow.

A NEW STABILIZER FOR SCHICK TOXIN

BY

A. T. GLENNY

AND

MURIEL F. STEVENS

Wellcome Physiological Research Laboratories

The improvement in methods of making dilutions of diphtheria toxin used in the Schick test has steadily increased their stability during the past sixteen years and now such dilutions remain unaltered for at least six to twelve months or more at room temperature. We have retested many batches that have been returned to us from such distant places as Bombay, Shanghai, Capetown, the Federated Malay States, and the Argentine. These dilutions have travelled by ordinary post or by air mail and have always been of full strength when tested on their return. Recent papers, however, have shown that the present dilutions produce allergic reactions in a very small percentage of subjects. H. J. Parish (1936) summarizes fourteen such cases including one with very severe reactions attributed to peptone reported by G. Bousfield (1936). The possibility of producing with Schick toxin a severe allergic response to peptone has induced us to find another stabilizing agent free from this disadvantage. We propose for the purpose human serum.

Experimental Work

The strength of Schick toxin dilutions has been measured quantitatively at the Wellcome Physiological Research Laboratories by the determination of the minimal reacting dose in guinea-pigs and by titration against antitoxin (Glenny and O'Brien 1921). Stability has been judged by tests made after exposure to higher temperatures than would be encountered during normal storage. As improvements have been made so we have increased the temperature by different stages from 30°C to 45°C. Results of this rapid test for deterioration have always been confirmed by subsequent tests on material left for long periods at room temperature. In his pioneer work in this country on diphtheria immunization Dr. R. A. O'Brien used for the Schick test dilutions in saline containing 0.5 per cent phenol, the common U.S.A. diluent. Such dilutions remained stable for a week at 15°C but retained only 5 to 15 per cent their original strength after twenty-four hours at 35°C. A few seconds shaking in partially filled bottles caused total destruction (Glenny *et al.* 1925). Experimental work showed that a buffer solution increased the stability of toxin dilutions and although a phosphate buffer was more suitable to use at the optimum pH for stability, a boric borate buffer (Glenny *et al.* 1928) of slightly higher pH was chosen for its bacteriostatic properties. Some batches of toxin diluted to Schick strength in buffer were more stable than others remaining at full strength for fourteen weeks at room temperature whereas others were only stable for four weeks. Weaker toxins needing less dilution were more stable than stronger toxins. Assuming that increased stability was due to a higher broth content, the next step was to increase the amount of broth in the dilution to 0.5 per cent. Such dilutions remained stable for six months at room temperature. Bunney (1931) suggested the use of 2 per cent peptone. Experiments at these laboratories showed that 0.1 per cent Witte peptone in borate buffer solution was sufficient to stabilize Schick toxin so that it would remain of full potency for twelve months or more at room temperature.

We have chosen human serum as the stabilizer which is least likely to cause allergic reactions or to act as a sensitizer in human subjects. It is necessary to choose serum which does not contain enough antitoxin to interfere with the balance between the toxicity and combining power (antitoxin binding power) of the toxin. We have used serum containing no detectable antitoxin (that is less than 0.0005 unit per ccm). The stability of Schick dilutions containing various amounts of human serum and of peptone is given in the table.

Diluent	Number of Days Exposure to 45° C. (Percentages of the Original Strength)					
	1	2	3	7	14	28
Boroborate buffer containing 1 in 1000 Witte peptone	85	80	70	55	30	20
1 in 1000 human serum	<40	20	—	0	—	—
1 in 500 "	75	60	45	25	10 or less	0
1 in 200 "	70	70	45	40	20 or less	0
1 in 100 "	90	80	55	45	30 or less	10

Experience of all former diluents has shown that any material losing less than 40 per cent of its potency after twenty-four hours at 45° C. remains stable for at least six months at room temperature. We consider that 1 in 500 human serum will remain stable (that is at least 80 per cent of its original strength) for six months at room temperature. This is sufficient for all practical purposes and although the toxin could be further stabilized by increasing the serum content to 1 in 100 this would involve the use of unnecessarily large amounts of human serum.

Summary

Dilutions of diphtheria toxin for use in the Schick test need a stabilizer.

Peptone has been used for this purpose but has been reported to cause allergic reactions.

Human serum is shown by animal experiments to be a suitable substitute.

Clinical Memoranda

Migration and Excretion of a Foreign Body

This unusual case is of interest because it demonstrates how Nature can occasionally deal with a situation in which surgery is powerless.

On September 24, 1936 a man aged 40 years wished to commit suicide shot himself in the chest with a revolver. The bullet entered the left sixth intercostal space half an inch outside the left mid-clavicular line. A skiagram showed a foreign body lying in the midline and just anterior to the tenth thoracic vertebra.

The patient developed pneumonia with a temperature of 102°. It was decided not to operate on account of the inaccessibility of the bullet and in view of the patient's poor general condition. Moreover he had undergone a gastro-enterostomy only two months before admission. Commitment was made upon the fact that the bullet although injuring the left lung had apparently missed such vital structures as the heart and the larger blood vessels.

Thirteen days later in the course of defecation the patient passed a foreign body in the stools. It was a bullet half an inch in length. A subsequent skiagram showed no evidence of a foreign body and the patient made a complete recovery.

Similar cases are rare. However Evans (1931) reports the migration of a 5-cm. piece of metal from the abdominal wall. Operation for its removal was unsuccessful and it was recovered from the stools four days later. He emphasizes the importance of taking a skiagram immediately before any attempt at removal with special consideration to the migrating tendencies of foreign bodies.

For permission to record this case I wish to thank Dr Edward Miles, medical superintendent of Oldchurch Hospital, Romford.

Temporary Post-traumatic Total Blindness

The following unusual case may be of interest. A man aged 22 was admitted to this hospital recently. His history was as follows:

CASE RECORD

2.50 p.m.—He received a slight kick in the right front leg region while playing Rugby football. He sat it out for a short time but continued playing.

One Day Later—Vision was almost normal in the left eye indistinct at more than four feet in the right eye. The papilloedema was much decreased being seen on the inner side of each disk only. The swelling on the forehead had subsided and there was no discoloration there.

Two Days Later—Visual acuity was normal in both eyes fields of vision were complete. The inner edges of the disks were still blurred. A skiagram of the orbit revealed no fracture.

Twelve Days Later—He had frontal pain on looking up pupils were wide and reacted normally. Examination of the fundi showed in the right eye a trace of papilloedema but no pulsation of the vessels the blind spot was increased by a quarter diameter. In the left eye there was slight papilloedema with marked venous pulsation, the blind spot was increased by two diameters.

It would appear that this man must have had a slight local haemorrhage immediately in front of the optic chiasma and affecting, at first, the right optic nerve more than the left. Unfortunately no lumbar puncture could be done on the night he arrived.

I am very much indebted to Dr Horatio Matthews consulting ophthalmic surgeon to the hospital for his advice and his permission to publish this case.

A Physical Sign in Perinephric Abscess

It is notorious that perinephric abscess is often missed till in a patient worn out and wasted with fever a large collection in the loin demands attention. The reason is that in many, probably most cases urinary signs and symptoms are absent, and so examination is not directed specifically to this area. If the condition is borne in mind diagnosis can be made at an early stage by means of the following test.

The patient is placed prone and quite straight and attention focused on the angle between the last rib and the erector spinae. Inspection may detect a slight fullness on one side but even before this change is visible palpation will reveal an increase in muscle tone. On the sound side the fingers can be dipped deeply in towards the kidney and on the other there is a demonstrable difficulty in doing so. There may be present to the examining fingers the sense of a deeply placed mass but this represents a relatively late stage of the disease. Tenderness is sometimes present. It is surprisingly inconspicuous.

Guarding of the muscles in the loin is not, of course, confined to cases of perinephric abscess. It may be seen for instance, after injury to the spine in osteo arthritis of the spine, and in perinephric infiltrations of other types such as haemorrhage. These are all as a rule easy to exclude. Pyonephrosis may give rise to some difficulty but the enlarged kidney is usually palpable and recognizable as such, and it is possible to eliminate this lesion if there be serious doubt by routine urological methods.

Operation in a case diagnosed thus early shows the kidney sheath rigid and pale in colour. When it is opened pus may be found at once, but if not the finger swept round the kidney will soon locate it.

In the second edition of Mr Hamilton Bailey's valuable book *Physical Signs in Clinical Surgery* reference is made to examination of these cases in the sitting posture. I believe that if the patient is prone diagnosis will be made even earlier and more certainly. In this position the muscles in the loin are completely relaxed upon the normal side. And, further the kidney tends to fall away from the examining finger thus accentuating the difference between the normal and what is found when we are dealing with a rigid and adherent kidney sheath as in cases of perinephric abscess.

Reviews

PSYCHOTHERAPY AND CONDUCT

Mind Medicine and Metaphysics The Philosophy of a Physician By William Brown D.M. D.Sc. F.R.C.P. (Pp. 294 7s. 6d. net.) London H. Milford Oxford University Press 1936

A series of addresses and essays by Dr William Brown now collected under the title *Mind Medicine and Metaphysics* forms a volume which will be of great interest to many people, including medical practitioners. The importance of psychology to medicine in all varieties of practice has now become recognized even officially and Dr Brown reminds us in his preface that metaphysics was defined by William James as an unusually obstinate effort to think clearly, and that metaphysics as the asking of ultimate questions about the nature of reality cannot be avoided any more than the speaking of prose. No more suggestive volume than this, for those who do not necessarily know a little of psychology and have a desire to think clearly about its practical application to medicine and its bearing upon fundamental ideas of philosophy can well be imagined. Since the successive chapters were addressed to various audiences medical and lay in varied circumstances there are in the book a good many repetitions of certain facts arguments and theories but this is no disadvantage because though the author's thought is consistent and coherent from beginning to end the volume need not be read through as a consecutive whole. The first three chapters are those which will be of most direct interest to medical readers so far as actual practice is concerned. They deal with psychotherapy in its relation to the miraculous, to physical treatment and to psychoanalysis. Other chapters deal with sex control, mediumistic trance, character and personality intermatrimonial relations moral obligation and free will religion and the group movement—all of course from the point of view of psychology.

As is well known the views of Dr William Brown on the nature and value of religion differ radically from those held by Freud, and he expounds and illustrates these views very clearly and effectively in the present volume. The survival of personality is another subject of general interest on which he has an excellent chapter. One of the chief merits of the book is the clearness with which the author makes and demonstrates certain distinctions differences and relations which are not always apprehended even by fairly instructed readers. As such may be instanced the relation between the method of suggestion and that of mental analysis, between functional and organic disease between will and imagination between moral and psychological factors in conduct and the essential differences between hypnosis and sleep, between confession and analysis between repression and self control. Dr William Brown emphasizes too, the value of mental analysis in enhancing the normal as well as in remedying the abnormal, and the extent to which health depends upon self-understanding and a right outlook and appreciation of the values of existence. From the point of view alike of medicine and of metaphysics this is an important and revealing book.

DEVELOPMENT OF PHTHISIS IN ADULTS

Die Entwicklung der Lungentuberkulose des Erwachsenen By Wilhelm Kremer (Pp. 38 55 figures R.M. 3.60) Leipzig Georg Thieme 1936

It is pointed out in the preface that the publication of this small book by Dr Wilhelm Kremer was prompted by the

discovery during post graduate teaching that there existed among practising physicians much vagueness about the development of pulmonary tuberculosis in adult life. The compilation of the brochure was made possible by the opportunity given to the author of obtaining a large number of serial skiagrams over a period of several years at a convalescent institution extensively used by the members of a large insurance society. Although Dr. Kremer states that a great many adolescents and adults develop pulmonary tuberculosis as the result of a primary infection during adolescence not more than 60 per cent of persons being infected at the age of 15 even in large towns he bases his description of the development of phthisis on the three stage theory of Ranke. Thus adult phthisis generally arises directly or indirectly from the pulmonary residua of the general dissemination constituting Ranke's second stage, even when the primary infection occurs in adolescence the sequence of events is similar, the corresponding intervals being shortened. Dr. Kremer admits, however, that an infiltration may arise without any obvious connexion with an old lesion though here too it is possible that the latter exists but is not detected radiologically because of its small size or peculiar situation. In sixteen excellent diagrams are depicted the various results which may follow primary infection including its progress to phthisis in the adult. Serial radiographs well reproduced, serve to illustrate the stage of generalization, its sequelae, and the development of the adult lesion.

This little volume can be recommended to clinical workers in tuberculosis who wish to obtain a clear picture of the conception that phthisis is the final episode of an infection in childhood.

THE LATERAL EYE MUSCLES

The Extra Ocular Muscles. A Clinical Study of Normal and Abnormal Ocular Motility. By Luther C. Peter. A.M. M.D. Sc.D. Second edition. (Pp. 351. 136 figures. 21s. net.) London: H. Kimpton, 1936.

Inevitably the greatest changes in the new edition of this book are to be found in the chapter on concomitant squint. A new part on operative technique makes its appearance while throughout the text stress is laid upon the more precise use of terminology. Thus 'diction' is limited to mean movement of the eye against prisms instead of the wider significance generally attached to the word. As an attempt at a comprehensive review of this branch of ophthalmology Dr. Peter's monograph stands alone among recent publications. Generally it departs but little from the accepted teaching though to English readers a good deal may appear of small practical importance. The sections on cyclophoria indicate that more attention is

contributions jostling cheek by jowl with recent publications of no particular significance. Nor do a difficult style and cross references make for readability. The nomenclature in the book, whatever scientific merit it may have, is distinctly confusing, and the ten page section on nystagmus presents many linguistic puzzles. What for instance could an English reader devoid of German make of 'endstellend nystagmus' not further defined or of the Brunner's *Dreschirm*? The author's weakness for fusing Latin words will not commend itself to everyone when such monstrosities as corticofugal and infra geniculate make their appearance, to say nothing of such barbarisms as *ex anopsia* spelt as if it were one word.

More care in proof reading would have avoided such misprints as 'synstagnus' (p. 339) and references to such non-existent bodies as the British National Research Council. The second edition represents a considerable expansion of the first. Should a third edition be called for it is the reviewer's hope that the book will have undergone a slimming course. If a third of its present bulk it would not be mirasmic.

A BIOCHEMICAL TEXTBOOK

Principles of Biochemistry. By Albert P. Mathews. (Pp. 512. 20s.) London: Baillière Tindall and Cox, 1936.

Professor Mathews like the authors of other textbooks of biochemistry, has been faced with many problems. In his *Principles of Biochemistry* he has done his best to overcome them and has been to a great extent successful. In the first place he has had to bring his book as far as may be up to date, in face of the bewildering rapidity with which new work makes its appearance. The experimental work proceeding in almost every civilized country is such that not only are fresh details of the subject coming to light almost from week to week, but observations are being made which change fundamentally our outlook at many important points. The discovery of the role of the anterior pituitary in carbohydrate metabolism is changing our conception of diabetes, the distinction between hormones, vitamins, and enzymes grows less and less sharp as one after another of these substances is isolated as a pure product and its chemical constitution studied. Our conception of the nature of nervous function may be fundamentally altered as evidence accumulates supporting the 'humoral theory' of nervous activity.

Not only must the author of a biochemical textbook be aware of all these rapid changes in and additions to existing knowledge but if he writes for student he must make up his mind how much of it is suitable for teaching purposes, for it is clear both that a limit must

The book contains an account of much new work, which is represented in a clear and interesting manner. Whether the chemical constitution of the carbohydrates deserves quite as much space as the author has given to it is a matter of opinion. It is possible that biochemistry may develop more rapidly in the future on the dynamic and biological side. If this should prove to be the case some method will have to be found of presenting to the student the fundamental chemical conceptions which it involves without loading him too heavily with chemical detail.

INTRANASAL IONIZATION FOR HAY FEVER

Hay Fever With Special Reference to Treatment by Intranasal Ionization. By Clive Shields B.M. B.Ch. (Pp 77 illustrated 7s 6d net.) London: H. Milford Oxford University Press 1937.

This book adequately fulfils its function of giving practitioners and students a detailed description of the author's technique of intranasal ionization in the treatment of hay fever. It contains a historical account of the aetiology of the disease which is excellent in every way. The description of the symptomatology and differential diagnosis will also be found interesting and helpful. There is an account of the anatomy and physiology of the nose and accessory sinuses and of the action of various drugs and their component parts on the mucosa; this too is admirable and as it is illustrated by photomicrographs it will carry conviction.

Some of the author's generalizations may be taken however *cum grano salis* because he appears to regard any other method than his own as being useless. For instance the results of previous desensitizing injections in a series of his patients are given as 82 per cent no relief, 18 per cent slight relief and none great relief whereas the results of his own form of treatment are given as complete relief or 90 per cent relief in 93 per cent of cases. This seems to the impartial observer a rather high average. The last chapter gives a clear and concise account of the technique of the author's method of treatment and from this point of view Dr. Shields's book is of interest; it is not however an unbiased contribution to the literature of hay fever.

This volume is excellently produced and printed and is of interest as giving an understandable account of one particular form of treatment of hay fever.

MENTAL DISORDER IN TIMES PAST

History of Notes on Psychiatry (Early Times—End of 16th Century). By J. A. Whitwell M.B. (Pp 252 10s 6d.) London: H. K. Lewis and Co. 1936.

Dr J. R. Whitwell, well known as the honorary librarian of the Royal Medico-Psychological Association and formerly medical superintendent of St. Andrew's Hospital, Melton, Suffolk, writes a curiously interesting book. The title is too modest for the contents which discuss in the light of modern knowledge the various forms of mental disease which have afflicted men from the earliest times to the end of the sixteenth century. Dr. Whitwell shows himself to be a man of very wide reading and an excellent scholar. He groups his notes into instances taken from the Bible from the Talmud from the Koran from the classics and from mediaeval literature. The mental states of Saul, David, Nebuchadnezzar, St. Paul, Hector, Achilles, Ajax, Cambyse and many others come under consideration and are placed in their proper classification. The views of Pythagoras, Plato and Aristotle are considered, and extracts are given from many of the classical

medical writers from Hippocrates and Avicenna to Felix Plater (1536–1614), the acute clinical observer who was among the first to look for a pathological basis of mental disorder.

The book is full of odd information. The reader will learn that fifty-one names have been given to epilepsy; he will learn much about the Nightmare and will be able to answer the question 'What is acedia?' which was long numbered fourth amongst the seven deadly sins. Of the Iodestone he is told: 'This hath a discerning faculty of a woman that is chaste and of her that plays the adulteress, for if any do set it secretly upon ye bed of ye chaste woman she being overborne with sleep both opens her hands towards her husband and cleaves close to him but the other being troubled with dreams with foul labours falls out of bed.' The latter part of the book contains a series of extracts and translations from many early writers on mental diseases which will prove a mine of information for those less skilled in the classics than is Dr. Whitwell. The last section contains some valuable chronological data.

Notes on Books

Dr A. G. AULD's book *The Nature and Treatment of Asthma, Hay Fever and Migraine* (H. K. Lewis and Co. Ltd. 12s 6d.) includes a selection from the author's clinical investigations which have been largely occupied by the subject of allergy. With the exception of one chapter all the material published in this volume has appeared in the columns of the *Lancet* or the *British Medical Journal*. The opening item is a lecture on asthma, given at the North East London Post Graduate College in 1908 and the final item is a case history dated 1885.

Dr ISRAEL BRAM, medical director of the Bram Institute for the Treatment of Goiter and Other Diseases of the Ductless Glands has in *Exophthalmic Goiter and its Medical Treatment* (Kimpton 25s.) brought out what is a nominal second edition of a work published in 1920 but the text has been so completely revised and enlarged that this is really a new book. It is based on an experience of more than five thousand cases during a quarter of a century and concentrates on the success of medical psychotherapeutic and hygienic measures. The author draws a sharp distinction between toxic adenoma which he regards as primarily a local condition and amenable to surgery and Graves's disease which is a constitutional state and does not respond in a satisfactory manner to mere thyroid ablation. Dr R. G. Hoskins of the Harvard Medical School in a brief and cautious foreword makes the best of this appeal against thyroidectomy and remarks that 'habitual reliance upon surgery as the therapy of choice may lead to a mental scotomosis.' It must be freely admitted that the thyroid may be secondarily and not primarily affected in Graves's disease but on the other hand from a practical point of view the available evidence points to thyroidectomy as the most successful form of treatment. The author who has obviously taken much trouble not only in the collection of his matter but in the manner of its presentation describes about twenty-four different types of Graves's disease and the Bram quinine test for hyperthyroidism—namely tolerance to 20 to 90 grains of quinine daily for several weeks.

Dietetics for the Christian by Dr MILTON A. BRIDGES of New York which was reviewed in our issue of August 18 1934 has now reached its third edition (Kimpton 45s.). In preparation for this new edition the author has made an extensive survey of the literature on diet therapy and has rewritten much of his text in the light of recent knowledge of foods and their nutritive, vitamin, and mineral constituents.

THE RECENT EPIDEMIC OF INFLUENZA IN GERMANY

[FROM A MEDICAL CORRESPONDENT IN BERLIN]

In Germany as in England influenza is not a notifiable disease but the data published by the Reichsgesundheitsamt respecting new cases of influenza and pneumonia reported to the sixteen largest Krankenkassen of the Reich give an instructive picture of the course of the epidemic. Table I sets out the figures down to the end of February received by four departments.

It will be seen from Table I that the course of even was different in the different cities. In Berlin the maximum was reached in the week ending December 5 in Breslau to the south east at the beginning of January. Frankfurt on the west had its maximum in the same week as Berlin as did Hamburg. Frankfurt recorded a higher maximum than the other three cities here tabulated but this was exceeded by Königsberg in East Prussia which returned a rate of 27.8 per 10,000 for the week ending December 19 and by Brunswick with a rate of 25.5. It is pointed out in the *Reichsgesundheitsblatt* (1937 Nr. 4) that the eastern and southern parts of the

Returns of deaths ascribed to influenza and pneumonia are available for all cities with populations of 100,000 or more and are shown in Table II.

TABLE II

Week	Deaths from	
	Influenza	Pneumonia
25.10.36—31.10.36	2	215
1.11.36—7.11.36	40	27
8.11.36—14.11.36	57	270
15.11.36—21.11.36	114	318
22.11.36—28.11.36	153	62
29.11.36—5.12.36	26	57
6.12.36—12.12.36	44	27

Reich tended to be affected later. This is illustrated by Breslau and Stuttgart. In Munich there was a peak on December 14 and a second maximum on January 4.

Having regard to the close and uninterrupted communication between such cities as Berlin, Breslau, Hamburg and Frankfurt these differences in the course of the epidemic must be referred to local perhaps meteorological factors.

The mortality figures of Table II show the accustomed parallelism between mortality from influenza and pneumonia although as we should expect the movement of the influenza record is more striking. Although a serious epidemiological event the epidemic in Germany as in England has been less serious than on some other occasions since the pandemic of 1918-19 and of course trivial in comparison with the pandemic of 1918-19.

MALARIA IN EUROPE

There have been few changes so remarkable in our outlook upon any disease as those which have followed as a result of the discovery by Ross of the mosquito cycle in malaria. Not the least remarkable of these changed conceptions are those arising out of recent researches and discoveries connected with the natural history of malaria and its prevention in Europe. It is no surprise therefore, to those familiar with this recent work to find Dr Hackett giving an account of the most up-to-date advances in malariology under the title of *Malaria in Europe*.¹ This book published under the terms of the bequest, is a presentation of materials gathered for the Heath Clark Lectures given by the author during December 1934 at the London School of Hygiene and Tropical Medicine. Prior to the war little importance was attached to the fact that malaria so important in the Tropics also occurred in a number of countries in Europe. Endemic malaria in the modern epidemiological sense was scarcely recognized as existing. Dr Hackett's book opens with an appreciation of what is now understood by this term, "the great complex and organized exchange of gametocytes and sporozoites which we now call endemic malaria." Endemic malaria in Europe is likened to "a great lake which a century ago was inundating all Europe but which after the middle of last century was found to be gradually draining away by unknown channels unaccountably subsiding to lower levels, abandoning first the cold north and then becoming shallow over great zones of Europe, finally revealing islands irregularly distributed here and there, but remaining in deep pools which were the permanent centres of the more extensive endemic range of the disease."

The causes underlying this 'silent almost unnoticed' withdrawal of malaria from Europe, which has had nothing to do with any conscious activities or efforts of man to bring it about has long been the subject of conjecture. Better housing improved economic conditions and many other reasons have been put forward to explain it but in large part at least it is now known to have depended upon quite unsuspected facts in the natural history of malaria itself. The basal and

underlying causes are related to the fact that the carrier species of anopheles in Europe, *A. maculipennis*, is not, as was thought until recently a single biological unit, but consists of some four or five subspecies, or even distinct species so similar in appearance that they can only be identified with certainty, even by the entomologist through differences in their eggs. But while in appearance so similar each of these subspecies possesses small peculiarities in habits and behaviour which have in so remarkable a manner fitted in with human affairs and influenced transmission that many of the major epidemiological features of malaria in Europe are to be explained on this basis. Under normal circumstances a female anopheles, through development of its ovaries and the necessity for oviposition, must every few days leave the house or stable where she has had her blood meal in order to deposit her eggs. When she returns for the purpose of feeding again she usually does not enter the same feeding place. The result of this is a sort of general post, the places where the insects are found resting during the day being no certain indication of where they have actually obtained their blood meal. With any particular race or species it depends upon the conditions and the anopheles's own predilections under these conditions how far their blood meals are obtained from man or cattle respectively, and hence how far the species by feeding more than once on man with the necessary interval for the development of sporozoites, is likely to be an effective agent in the transmission of malaria. It is for this reason that the "precipitin index" or percentage found under any given conditions to have made their last blood meal on man is now the most reliable index to the association of a species with malaria and its status as a carrier.

Thus the old idea of a species having a fixed value as a carrier has now become largely modified. In Holland and some other parts of Europe still existing malaria is associated with *atroparvus* and the forms *messeae* and *typicus* play no part. But these usually harmless forms can nevertheless act as carriers under different circumstances, as they do in some parts of Europe or at special times when the conditions under which the inhabitants are living are such as to favour this. The conditions determining the presence of endemic malaria in Europe are largely bound up with agriculture. Primitive agriculture is usually associated with malaria. With the rotation of crops comes the necessity to maintain cattle to feed on the fodder crops and stall feeding tends to replace pasture feeding. With 'stabulation' there come the optimum conditions for the deviation of any species of zoophilic habits, and if these zoophilic

¹ *Malaria in Europe. An Ecological Study.* By L. W. Hackett. M.D. London: H. Milford Oxford University Press. (10s.)

forms alone are present as is the case over a large part of Europe malaria disappears though anophelids are still abundant. In the carrying out of preventive measures the correct 'appraisal of the malaria situation' becomes of great importance. In the presence of an inveterate human feeding species such as *labiacluae* or *clutus* Dr Hackett maintains that no improvements in agriculture, housing or social status are likely to be effective and the species must be attacked in its breeding places or if this is impracticable all human dwellings must be screened. But with *atroparius* and still more so when malaria is associated only with *messeae* or *typicus* preventive measures aiming at deviation are more appropriate. Such 'species sanitation' does not only apply to Europe and much work has been done recently in the Tropics in the way of tracking down the inveterate human feeder and devising methods for its elimination.

All such recent ideas on carrier species and many other matters of great interest in connexion with malaria such as the part played by the parasite itself and the role of immunity in man as well as the nature of attack methods are dealt with in Dr Hackett's book. This is by far the most informed, readable and up to date popularized account of the malaria situation as we now know it that has come to our knowledge. Dr Hackett himself is one of the chief pioneers in these fields.

LEGISLATION FOR THE DEAF

The demand for a Deaf Persons Act is cogently set forth in the annual report of the National Institute for the Deaf. Proposals for such legislation have the practically unanimous support of all organizations which make this section of the community their special care. Save for the education of children in special schools almost everything that has hitherto been done to help the deaf has been carried through by voluntary effort but voluntary effort cannot fully cope with the economic side of the problem and the co-operation of the State is becoming more and more necessary. The county and county borough councils were asked some time ago by the Ministry of Health to exercise their powers under the Poor Law Act 1930 to make grants to the local societies for the deaf and dumb in order that these might act as employment agencies for their members. The response, however, has been disappointing. Reasonably adequate grants have been made in but a few areas, insufficient grants in the majority and in some areas none at all. The friends of the deaf feel that the State should become responsible for the deaf as it is

already for the blind. There are in this country 40,000 persons who are deaf-born—that is who were deaf before speech could develop—and an unnamed number who have become deaf through disease or accident later in life. It seems obvious that the settlement of these people in employment should be a State concern. Voluntary effort can find plenty of exercise in devising measures to mitigate their loneliness and draw them into the social circle.

The latest report (the first to be issued from the new headquarters of the National Institute at 105 Gower Street, London, which was opened in June last by our present King, then Duke of York) shows how much kindly help is available for the deaf through local societies and regional associations. The National Institute itself does a surprising amount of good work on an annual expenditure insufficiently met by income of under £2,000. It is to be hoped that a Deaf Persons Act may before long find its way on to the Statute Book. One of its provisions, the Institute considers, should be the lowering of the compulsory school beginning age of deaf children from seven to five years. This has been advocated by teachers of the deaf for a generation and is known to have the sympathy of the present Minister of Education. A second provision which is urged is the extension of State assistance where necessary for all cases of disabling deafness irrespective of its origin or the age of the sufferer. Again about 400 deaf and dumb children leave the special schools at the age of 16 each year and the task of finding suitable employment for them is one of obvious difficulty. It is suggested that the obligation be laid on county and county borough councils to train deaf adolescents as well as to retrain in suitable occupations those who because of their affliction cannot follow their normal calling. At present the regional associations for the deaf of which there are six covering England and Scotland act as intermediaries between the local societies for the deaf and the schools but it can be argued with a great deal of force that the responsibility for the preparation for industry of these school leavers should fall on the community as a whole.

The committee of the National Institute is now sponsoring a piece of research into the most suitable occupations for the deaf. This is being directed from the department of industrial physiology of the London School of Hygiene and it is hoped that as a result suggestions may be made to employers whereby through an appropriate training of members of their staffs a bridge is built between some of the unemployed and the result of acquired deafness may be prevented. Yet another provision which might well fit into

measure would be the earlier granting of old age pensions to deaf persons who by reason of sickness or other infirmity can no longer be employed. Among those who have started life with so heavy a disability there will always be a number whose capacity for work ceases at an earlier age than the normal. Finally, it is advocated as a part of the measure that there should be set up an advisory committee on the deaf for the consideration of matters referred to it by the Ministry of Health and other departments and for bringing matters on its own initiative to the attention of the Government.

IMMUNIZATION AGAINST DIPHTHERIA

The results of epidemiological surveys of comparable groups of Baltimore children in respect of diphtheria morbidity and carrier prevalence and of antitoxic immunity as estimated by the Schick reaction during the two periods 1921-4 and 1933-6 have recently been published by W. H. Frost¹ and others.² The individuals investigated in each survey were alike in respect of environment, season of the year and age distribution; such differences as existed were so slight that adjustment did not alter the figures significantly. So far as possible a uniform bacteriological technique was followed but the use of highly selective media particularly of the tellurite-cystine-blood agar in the later years led to an appreciable and increasing proportion of successful attempts at isolation of *C. diphtheriae* where whole culture virulence tests were negative—4.5 per cent against 1 per cent in the earlier years. The suggestion that whole-culture virulence tests may be safely employed as a substitute for the more elaborate procedure of isolation in pure culture is hardly borne out by the later findings. When due allowance is made for the discrepancies in the bacteriological results it is seen that during the period between each survey the prevalence of *C. diphtheriae* fell for the season November to March inclusive from 2.44 to 1.08 per cent. The difference in the numbers examined 3,319 and 3,288 respectively is large enough to place them well beyond the range of probable sampling variation but insufficient to permit of precise measurement. In the earlier survey the carrier-frequency was higher in the 5-9 years age group than in the 10-14 years group; the figures for November and December were slightly in excess of those for February and March but not enough to be of statistical significance while in the 1934-6 survey the carrier frequency was generally so low that but little importance could be attached to the small differences that were observed. Comparative observations on negroes and white children revealed no significant difference in the 1921-2 survey and the numbers of the former under observation in the later survey were too meagre for adequate comparison. The period of accelerated decline in carrier-frequency corresponded fairly closely to the time when artificial immu-

nization on a large scale was being carried out in Baltimore although the numbers actually immunized were relatively small in comparison with the observed lowering of morbidity. The Schick-positive rate among white children of the age group 5-14 years in 1921-2 before artificial immunization was introduced was compared with the rate recorded in 1933-4 by which time immunization had been carried out on a restricted scale for some eight years and on a large scale for five years; the proportion was seen to have fallen from 49.4 per cent to 32.3 per cent—that is a ratio of 1 to 0.65—the reduction remaining fairly constant in the separate age groups. Among unimmunized subjects the proportion of Schick-positive reactors was approximately the same in both surveys 45 per cent. Following the diminished incidence in identified carriers a decline in the amount of natural immunization might have been expected but for the fact that all save the youngest children have been heavily exposed to infection before 1928 when the marked reduction in morbidity was first observed. Since just over 50 per cent of the children had received artificial immunization and the Schick-positive rate fell by no more than 35 per cent the efficiency of immunization as determined by the Schick negative state is rather less than 70 per cent. This low rate is attributed partly to the long interval—five to ten years—between immunization and retest when a proportion of relapses may reasonably be expected and partly to the fact that not all had had the complete course of inoculations. The data presented here do not support the assumption that liability to infection is less among Schick-negative reactors than among non-immunes but they do show that over a given period the former group is less liable to diphtheria. On the other hand, only a proportion, generally small of positive reactors who become infected with *C. diphtheriae* suffer clinical attack. In 1921-4 the proportion observed to contract the disease was several times greater than it was in 1933-6. The authors believe that artificial immunization is the main factor in reducing diphtheria morbidity; the other two important factors which may influence morbidity—namely diminished infection frequency and a lowered ratio of attacks to infections—are held not to be related directly to artificial immunization. Moreover they consider that changes in the dispersibility and virulence of the causative organism or alterations in host resistance not necessarily specific in character or a combination of these factors are more likely to be responsible for the decline in morbidity than altered environmental conditions such as improved hygiene and housing or reduction in the size of families.

Further information on artificial immunization and morbidity of diphtheria is given in a comprehensive report issued by the United States Public Health Services which describes a survey of 130 localities situated in eighteen different States between 1928 and 1931. It was ascertained that immunization had been afforded to 43 per cent of all children under 9 years of age but that at older ages the rate declined progressively until in the 20-24 years age group there was a history of immunization in only 5 per cent. During the same period 7 per cent in this group gave a history

¹ Amer. J. Hyg. November 1936 p. 568.

² Publ. Hlth. Rep. Wash. December 18 1936 p. 1736.

of clinical attack. In the course of twelve months 305 per cent of the children under 15 years were artificially immunized; the measure was applied just as frequently in rural areas as in the towns but the incidence of the disease was as is usual much higher in the latter. The immunization rate was seen to rise in correspondence with increase in the family income so far as the pre school child was concerned but at later ages no consistent relation between immunization and income was observed. The amount of artificial immunization and the incidence of diphtheria in particular localities are detailed but no clear-cut epidemiological conclusions emerge, this may be attributable in part to differences in the intensity and scope of the immunization campaigns sponsored by the various public health authorities.

PERIARTERITIS NODOSA

Since the recognition in 1866 by Kussmaul and Mier of periarteritis nodosa a spite of literature has not thrown much light on the aetiology of the condition. McCallum¹ states that it 'is essentially an infective process which produces changes in the media and intima of small arteries with cell exudation and hyalinization followed by more extensive leucocytic infiltration of the adventitia and immediately adjacent tissue'. Harris and Friedrichs believe that the disease is caused by a filterable virus. In a recent account of seventeen cases observed personally Rose Spiegel² reports that the disease was often preceded within two months of its first manifestation by an infection, tonsillitis, sinusitis or scarlet fever occurred in seven out of the seventeen cases. Klotz by injecting streptococci or serum into rats highly sensitized against streptococci chains to have produced similar lesions in these animals. The suggestion is put forward that periarteritis nodosa is an allergic phenomenon, allergy thus adds another disease to its list. The injury to the vessel wall leads to the formation of aneurysms, to thrombosis and to haemorrhage. The occurrence of purpura suggests that the capillaries are also affected. The course of the disease may be acute, subacute or chronic and the result is in most cases fatal although recoveries have been recorded. It appears at any age and is commoner in males. In Rose Spiegel's series cardiac lesions were found in all the fatal cases—that is in fifteen out of seventeen. The coronary arteries were frequently involved, pericardial haemorrhage from rupture of the vessels occurred twice and auricular necrosis once. Aschoff bodies were found in four cases and pericarditis in three. The disease was present in just over half the

a second died of renal haemorrhage. Vascular lesions were responsible for scattered ulcerations in the intestinal tract and haemorrhagic pancreatitis occurred in three cases. The skin lesions were various, tender reddened or slightly scaly nodules, purpuric spots and urticaria. A condition which was apparently a reaction to the course of the disease rather than a result of the vascular changes was polyserositis involving the pericardium, the pleura or the peritoneum.

THYROID THERAPY IN CRETINISM

It is common experience that whereas the physical development of cretinous infants is almost invariably benefited by the administration of thyroid, the effects of therapy on the mental state are much less certain. Tredgold has suggested that there are in fact two types of cretin, one in which the mental and physical retardation are both due to hypothyroidism and one in which a primary amentia is complicated by hypothyroidism. In spite of the recognition of such discrepancies in thyroid therapy and of the enormous literature on cretinism (thirty years ago 2468 titles were listed) a recent publication from the Clinic of Child Development and the Department of Pediatrics, Yale University School of Medicine is said to be the first detailed objective study of the effect of thyroxine on early mental growth. The authors Drs A. Gesell, C. T. Amatruda and C. S. Culotta³ have investigated six cases of cretinism or hypothyroidism in which the condition had been recognized and adequately treated in infancy and have included for comparison a normal infant and an adult male cretin untreated in infancy. The mental findings were formulated quantitatively using the Yale norms of infant development. The methods of studying and recording mental progress were largely those which the senior author has already made familiar; extensive cinematograph films were made for permanent record and comparison. The appearance and disappearance of cretinoid signs and symptoms were charted in individual cases over the period of study. It was found that of the six children investigated two remained mentally defective and four reached a fair degree of normality. On the other hand all six patients who before treatment showed no pronounced variation from the physical picture of cretinism lost the cretinous stigmata and habits. In giving a prognosis of mental development the authors point out that those patients did best who reacted best to small doses of the dried gland and were intolerant of larger doses, whereas those in whom mental development was unfavourable did not display this intolerance.

NOTES OF THE WEEK

Prescription Forms Supplied by Chemists

The attention of the Central Ethical Committee of the B.M.A. has been drawn to the fact that certain members of the profession are using prescription forms supplied by a firm of chemists the name of which is printed at the foot of the form. The Committee considers it very undesirable that medical practitioners should make use of prescription forms bearing the name or the advertisement of any individual pharmacist or firm of pharmacists.

Public Medical Service at Llandudno

A public medical service, designed on the lines of the Association's model scheme has been formed for the Llandudno district. The subscription rates for the service have been fixed at

1 adult	6d per week
1 adult and 1 child	8d
1 adult and 2 children	10d
1 adult and 3 or more children	1s
Additional adults	6d

A person over the age of 16 is considered an adult.

The scheme comes into operation on April 3, and all the doctors in the area are co-operating. Dispensing is to be undertaken by the local chemists on the same basis as the national health insurance and the pricing will be done by the National Pharmaceutical Union. The scheme has caused considerable interest in the district, and promises to start very successfully. Practitioners in the Conway area have made requests for their area to be included in the scheme, and this matter is being considered.

Control of Proprietary Medicines in South Africa

A Bill has been introduced into the South African Parliament for the control of advertisements of proprietary articles. It proposes that all such advertisements shall state the name and address of the manufacturer and that if the article advertised is an appliance, its specific use shall be stated. Other provisions are that an advertisement may not contain any reference to testimonials, offer free treatment or supplies of the article advertised, contain the expressions "doctor," "physician," "medical practitioner" or "surgeon" invite correspondence from the public contain a statement that the

article is a cure or specific remedy for any disease or pathological condition, or state that the article is a palliative unless the nature of the palliative action is clearly stated. It is proposed to form a register of proprietary articles, and advertisements may not contain any information which differs from that which is given to the registrar. The Bill contains a schedule of disorders which proprietary articles may not claim to cure and this schedule includes all those conditions which the Select Committee in Great Britain recommended for prohibition and also many others.

Air Raid Wardens

The Air Raid Precautions Department of the Home Office has recently issued "Memorandum No 4," which explains the need for an organization of citizen volunteers to augment and relieve the normal resources of the civil authorities for safeguarding the general public in time of air attack. The chief duties of these volunteers who will be called air raid wardens will be to advise their fellow citizens on the officially recommended precautions and in time of war to assist them immediately in any trouble resulting from air raid damage and generally to act the part of a good neighbour. It is considered that the responsibility for initiating the new service should rest with local authorities. Alternative schemes of organization are suggested and the qualifications and training of the wardens are discussed. The Memorandum is published by H.M. Stationery Office, price 2d (post free 2½d).

Dr T. C. Routley, General Secretary of the Canadian Medical Association, which is affiliated to the British Medical Association is now on a visit to this country in order to study national health insurance problems.

The Report of the Royal Commission on Tyneside Local Government recommends the establishment of a Northumberland Regional Council which shall deal with public health, medical and other services including mental hospitals, mental deficiency and public assistance.

The Minister for Home Affairs in Northern Ireland has appointed a committee to inquire into the organization of the maternity services in the country. Evidence is to be invited from witnesses interested in the different aspects of maternity services.

THE ASSOCIATION AND PUBLIC HEALTH

In addition to a large agenda of some twenty five items, the Public Health Committee of the Association at its meeting on March 12 had several reports of subcommittees and other documents to consider. It also received a deputation from the Consulting Pathologists Group Committee in support of a scale of fees—which the Public Health Committee approved—applicable to the testing of designated milk in accordance with the requirements of the Order.

Nursing Problems

A report was brought forward by a subcommittee appointed jointly by the Public Health and Medico-Political Committee in response to a communication from the College of Nursing seeking the views of the Association on such questions as interchangeability of pensions, the establishment of a domiciliary nursing service, and the supply of and the demand for the services of the trained nurse by the community.

Professor Picken from the chair, said that the subcommittee had given a great deal of time to the preparation of this document, which he presumed would be sent to the College of Nursing in the form of a reply. It was a useful piece of work, and one likely to bring the Association into closer touch with the organizations representing the nursing profession and demonstrating interest in nursing problems, which were to a certain extent also the problems of the medical profession in the public service and in the service of institutions.

On one matter the joint subcommittee had forsaken its strict terms of reference, and had put forward a view on the question of the examination papers of the General Nursing Council. It was explained that there was a natural desire on the part of those controlling entrance to the nursing profession to eliminate the illiterate nurse who still by some means or other occasionally made her appearance, but, on the other hand, to exact too high a standard in this respect meant that a whole class of persons of reasonably good education and with a personality well fitting them to be good nurses were in some danger of being turned down because they were not good examinees. On a particular point the subcommittee brought forward a recommendation—which was accepted by the Public Health Committee—that while it was appreciated that the General Nursing Council desired the education of the State registered nurse to reach a high standard both in theoretical and practical subjects it was difficult to understand why it should be necessary or indeed advisable for nurses to have the knowledge required to enable them to answer some of the questions set in the examination papers which relate to diagnosis and medical treatment as distinct from nursing care. It was considered that the inappropriate nature of such questions might be a possible cause of the difficulty experienced in securing a sufficient supply of State registered nurses.

The full report of the subcommittee is being sent to the College of Nursing and it is intended that it should appear in the *Supplement*.

The Role of the Health Visitor

The Committee had a brush with the Ministry of Health over the Minister's circular No. 1550 concerning children under school age. That circular had been considered at a previous meeting when attention was drawn to the fact that the conception of the circular was that such children should be visited at regular intervals by a health visitor who should only refer them to a medical practitioner if she had grounds for suspecting disease or defect. A letter to the Ministry was accordingly sent in which it was pointed out that this was not the generally accepted view of the medical profession, who held that children under school age should be safeguarded. The children should be under the medical supervision and seen from time to time by

a medical practitioner in order that the progress of the child might be noted and the mother advised as to the regime. The circular in fact was felt to magnify unduly the part the health visitor played in this work. It was pointed out that the Association had no desire to minimize the work of the health visitor, but it was unable to see how an increase in the health visiting staff alone without a corresponding increase in the medical supervision of the child would bring about the desired result.

To this letter it was reported that a reply had been received, in which the following passage was especially noted:

In the Minister's view health visitors are well qualified as a result of their training and experience to give valuable assistance and advice to mothers in the care of their children in matters of personal and domestic hygiene and when early manifestations of departures from normal health or development are present to recommend the seeking of medical advice in such cases.

As though, as one member of the Committee put it, medical advice were only called for when there were departures from the normal or as if medical attendance upon these young children was only a question of treating them in illness. A melancholy conception of the function of the profession to be entertained in Whitehall! It was resolved to send a rejoinder on those lines.

The Midwives Act in Operation

Dr W. Paterson, chairman of the Maternity and Child Welfare Subcommittee, reported that from information received at the Head Office sixty Branches or Divisions of the Association had appointed representatives for the purpose of consultation with local supervising authorities, and that such consultations had taken place with representatives of twenty-four county and thirty-one borough councils. In two instances the local supervising authority had failed to consult representatives of the profession in accordance with the Act and representations had been made to the Ministry.

It was reported that in the various schemes prepared for submission to the Ministry the policy outlined under the following headings had received a fair amount of recognition: (1) the desirability of the provision by the local authority of an adequacy not only of midwives as midwives but of midwives as maternity nurses; (2) the necessity of securing free choice of midwife by the patient as far as practicable; (3) arrangements for booking to be made direct between patient and midwife rather than through an officer of the local authority; (4) nomination by the patient of the practitioner who would be called in by the midwife if subsequent events made this necessary; (5) distinction between salaries according to qualifications and experience of midwives who are employed by local authorities. On another point Branches and Divisions have been advised to press for two scales of assessment of patients' contributions: one for the services of a midwife as such and the other for the services of a midwife acting as a maternity nurse on the assumption that a woman who books a doctor and midwife acting as maternity nurse is less able to pay than a woman of the same income who contents herself by booking a midwife only. It was stated, however, that in the schemes so far to hand there was a definite tendency to charge the patient the same contribution whether the midwife was engaged as such or as a maternity nurse.

It was also mentioned that the London County Council scheme was not yet available, but that the implications of the Act had been discussed with the Chief Medical Officer. The Metropolitan Counties Branch had intimated a willingness in connexion with the application of the Act to approach practitioners in the L.C.C. area as to whether they were desirous of having their names included on a panel of practitioners prepared to act in an emergency when called in by a midwife. The Branch was also prepared to compile a list of such practitioners and submit it for the use of the Chief Medical Officer.

One suggestion made in the Committee was that a double list should be prepared—namely, a list of practitioners who are ready to attend any case on the request of the midwife, and a list of practitioners who are prepared to attend only cases in the families of their own practice. It was felt that many practitioners, while prepared to attend the latter, might not wish to be subject to a wider call.

Agreement with the Society of Medical Officers of Health

The Committee gave consideration to a proposal for a slight modification of the agreement between the Association and the Society of Medical Officers of Health. The agreement consists of two main paragraphs, the first dealing with the question of interrepresentation, two representatives of each council having seats on the other, together with representation on the Public Health Committee, and there is no suggestion that that arrangement should be altered. The other paragraph makes the Association responsible for the medico political activities of the two bodies. It has been found in recent years that the agreement in its existing form rather tied the hands of the society in making representations and formulating policy in relation to public health on matters with which the Association was not really concerned. The efforts of a joint conference have been directed to the recasting of this part of the agreement, so that it will be mainly on matters affecting the interests of public or private medical practice of mutual concern to both the society and the Association that there will be any tying of hands, and on other matters of common interest there will be machinery for more rapid communication.

It is unnecessary to set out the precise terms of the revision, which was arrived at with the greatest good will on both sides and approved by the Public Health Committee. It is expected that the new agreement will make not for more harmonious working—for the working is already as harmonious as could be desired—but for greater expedition and convenience.

HOSPITAL RESIDENT MEDICAL OFFICERS

The Council of the British Medical Association has approved the following statement of the principles which should guide hospitals in the appointment and employment of junior resident medical officers.

The conditions of work of resident medical officers vary so greatly, as between large hospitals with several residents, small hospitals with few residents and special hospitals with special functions that no advantage is served by formulating detailed model rules applicable to all. The following statement of certain principles may be a help to hospitals in formulating or revising their rules on the duties of resident medical officers.

Note 1—The term "responsible medical officer" is used in this Statement of Principles to denote (a) in voluntary hospitals a member of the honorary staff (b) in council hospitals the Medical Superintendent or one of his deputies.

Note 2—In the case of voluntary hospitals with a Medical Superintendent or House Governor some of the duties assigned to the responsible medical officer might suitably be devolved on him and in council hospitals with a visiting medical staff some of the duties might properly be devolved upon the members of this staff.

1 Resident medical officers must be registered medical practitioners possessed of such qualifications as the Committee of Management may determine and should devote their whole time to the service of the hospital.

2 Their duties should be such as are required by the Committee of Management of the hospital.

3 (a) These duties should include the admission and discharge of inpatients in accordance with the wishes of the responsible medical officer in charge of the case. (b) They may be required to give lectures to nurses. (c) They may

be required to examine and treat nurses and servants and in serious cases should report to the responsible medical officer.

4 They should as soon as possible notify the responsible medical officer of the admission of urgent and important cases and of any serious change in the condition of any case.

5 They should not permit any patient prescription paper or notes to be examined by anyone without the sanction of the responsible medical officer and should not furnish any person unconnected with a patient with any information respecting the case without the sanction of the responsible medical officer and the consent of the patient.

6 They should have instructions as to their powers to limit the admission of visitors.

7 Off-duty time. (a) Off-duty time should be a matter of arrangement with their colleagues and of agreement by the responsible medical officer and generally speaking resident medical officers should be permitted to be absent from the hospital for short periods when their routine work for the day is done. (b) They should not be absent for long periods (for example, a whole day or night) without the sanction of the responsible medical officer. (c) Not more than half the resident staff should be absent from the hospital at the same time. (d) Resident medical officers must arrange with their colleagues for the performance of their duties during their absence. (e) Resident medical officers should have definitely prescribed periods off-duty (for example, two half-days per week after 2 p.m. and alternate Sundays after 11 a.m.) These periods are in addition to those referred to in (a) above.

8 Resident medical officers should have two weeks holiday for every six months completed service.

9 The responsibility of the senior and junior resident medical staff for giving certificates and medical reports and their entitlement or non-entitlement to retain fees for them should be clearly defined in the hospital rules. Resident medical officers should be permitted to issue certificates and reports which are required for legal purposes under the general authority only of a responsible medical officer. Copies of all such certificates and reports should be retained in the hospital records.

(Note—It is customary in hospitals particularly voluntary hospitals for resident medical officers holding short term appointments to be allowed to retain fees for such certificates and reports and for evidence given in a court of law.)

10 In the case of hospitals with one resident medical officer only it is of urgent importance that the Committee of Management should arrange with a non-resident medical officer to be on short call for the purpose of urgent duties in the absence of the resident medical officer.

11 Resident medical officers should as a condition of appointment be or become members of one of the medical defence societies.

12 The appointment of resident medical officers should be for a specified period with possibility of renewal and should be determinable by reasonable notice on either side.

MEDICO-POLITICAL ACTION OF THE ASSOCIATION

The usual meeting of the Medico-Political Committee of the Association held on March 17 under the chairmanship of Dr J. W. Bone was occupied morning and afternoon on a wide range of important business. It had before it the minutes of no fewer than five subcommittees, various questions submitted by Group Committees and Divisions, proposed legislation such as the Government's new Factories Bill, and a dozen items arising under correspondence on which it was asked to consider whether any point of principle arose on which the Association should take action.

The Factories Bill

On the Factories Bill the chairman reported that the Home Office had been interviewed but that only a few of the suggestions previously made by the Committee were included in the text of the Bill as introduced into Parlia-

ment by the Home Secretary. The joint committee set up some time ago to facilitate communications and common action where desired between the Association and the Trades Union Congress had appointed a sub-committee, which had considered certain further amendments to the Bill and these amendments being agreed on both sides had been conveyed to the Home Office. They related to such matters as the temperature of work-rooms, adequate lighting, inspection of fire escapes and first-aid boxes, rest periods and medical examinations for fitness for work. It was urged that as a general rule the works medical officer should not be appointed examining surgeon and that the latter should be allowed opportunities apart from any direction of the Secretary of State to make special inquiry and examination whenever he deemed this to be necessary, and should have the right, subject to the consent of the employee, to inspect the records of the medical officer employed by the management.

An important proposal was made with regard to the employment of pregnant women. The Home Office was urged to accept the recommendation of the Departmental Committee on Maternal Mortality and Morbidity that pregnant women should not be employed in factories during the last six or eight weeks of pregnancy. It was not yet known how far these proposals had impressed the Home Office, but the Committee thought it well that the medical members of Parliament should be informed of their nature.

Rules for Industrial Medical Officers

At its previous meeting the Committee had considered and after amendment had approved certain draft rules for industrial medical officers and decided that they should be submitted to the Central Ethical Committee. The latter had made certain amendments largely verbal and these were approved. One rule as it had left the Committee laid it down that no pressure or persuasion should be used to influence the worker to undergo treatment at the works clinic and to this had been added except in case of first-aid or emergency treatment. The Central Ethical Committee had also suggested the rewording of another rule which stated that where the special experience of the industrial medical officer might be of assistance in the diagnosis and treatment of a case the medical officer might offer to meet the works practitioner in consultation. It was thought that a better reading would be "The industrial medical officer should where possible respond to any invitation to meet the works practitioner in consultation."

One member of the Committee urged strongly that the time had come when a system of training for first-aid people, nurses or others, should be recommended. He pointed out that a good deal of industrial disability could be stopped if persons immediately at hand knew what to do in an emergency. It was decided as a first step to ask the Association of Industrial Medical Officers for its observations on the subject.

Proposed Diagnostic Consultation * Clinique

A proposal was before the Committee from Dr H. S. Collier, reader in industrial medicine at the University of Birmingham, transmitted through the honorary secretary of the Birmingham Division for the setting up of a diagnostic out-patient consultation clinic for diseases of occupation and industrial illness and disability. Dr Collier attended in support of his proposal and described the object of such a clinic as designed to fulfil three purposes: the diagnosis of occupational illness and injury, the discovery of occupational factors in the causation of ordinary illness and ill health, and the recommendation of preventive measures or safeguards. Treatment would fall outside its scope. The advantages of such a clinic would be that the examinations of patients would be by a generalist of recognised standing, which the Division of Industrial Hygiene and Medicine must

undertake, laboratory investigations and research could be correlated with clinical material, and an opportunity would be afforded for extending the clinical aspect of the teaching undertaken by the department.

Asked whether such work was not already covered by the Industrial Research Board, Dr Collier said that the Board was doing a good deal in London but not so much in provincial centres and there would be no risk in such a field of duplication of work. He thought that probably the best plan would be to link up the University clinic with one or other of the voluntary hospitals and to hold evening sessions to which practitioners or consultants could refer cases, the clinic being also open at any time by appointment for patients referred by local doctors.

The Committee decided to defer to its next meeting a decision on Dr Collier's proposal and in the meantime to have evidence collected as to the scope and need for such a clinic.

Payments to General Practitioners Under Provident Schemes

Dr R. Forbes, who has been chairman of a sub-committee to investigate the possibilities of payments being made for general practitioners' services as part of a provident scheme, gave a report on the subject. The matter arose out of a motion brought forward at the last Annual Representative Meeting when it was referred to the Council to explore further the problem of the insurance of persons of the middle and professional classes in respect of all illnesses whether treated institutionally or at home, with the object of producing if possible a scheme whereby such a service might become available as a benefit additional to those provided by the existing Provident Schemes for middle-class patients.

Dr Forbes stated that the principles of such a scheme of insurance had been fully considered. With regard to the provision of general practitioner treatment it was felt that a scheme of insurance must define schedules of fees varying proportionately with the premium proposed, an initial payment by the patient to be deducted from all claims, the annual limit to which claims would be met, and a reduced premium where no claim was made in the previous year. A scheme of insurance should provide a grant-in-aid towards the cost of domiciliary nursing, maintenance and nursing while the patient was in inmate of a hospital or nursing home and consultations and operative or other specialist treatment. It was considered that it would be impracticable to afford full "cover" against the cost of treatment. As a result of further consideration and a second meeting the subcommittee found itself unable to recommend the formulation of any scheme on a mutual insurance basis to give effect to the proposals made at the Annual Representative Meeting and that it would be impracticable to provide full cover at attractive premiums against the cost of a complete general practitioner service. It was added however that at its next meeting the subcommittee was to discuss with the representatives of two important insurance companies the outline of a less ambitious scheme.

Mortuary Facilities

The Committee had before it the results of inquiries made in a number of rural Divisions as to the mortuary facilities in their areas. These showed that in many areas there was dissatisfaction in this respect—in some cases profound or considerable dissatisfaction was noted—and in most areas the facilities were inadequate. It was suggested that the reason for the absence of proper facilities in many country districts was that the county councils had no power to establish mortuaries, the parish and district council being the authority in this respect. The chairman of the Committee said that he thought it might be urged to the Ministry of Health that when the opportunity for legislation arises steps should be taken to confer the necessary powers on county councils. In the meantime it was decided to urge the Min-

Health to exercise the powers given to him under the Public Health Act, 1936, which comes into force next September

Medical Representation in Parliament and on Local Authorities

A report was made by the subcommittee appointed to consider the question of the representation of the medical profession in Parliament and on local authorities. The view put forward by the subcommittee was that the peripheral machinery of the Association is overloaded with the result that the implementation of central policy is hampered, and it was decided to recommend that an investigation be made into the peripheral organization with a view to strengthening it, particularly in regard to Parliamentary and local legislation and so that central policy generally may be more effectively carried out. It was also suggested that at stated times in each year the Divisions and Branches should be urged to take action upon the lines of the resolution of the Annual Representative Meeting last year—namely, to encourage members to interest themselves in local politics and offer themselves as candidates through the recognized machinery in view of approaching municipal and county council elections. Among other recommendations on the subject was one that the appropriate portions of circular letters relating to general Association policy which are sent by the Medical Secretary to the secretaries of Divisions and Branches should also be sent to medical members of local authority councils. Certain recommendations were also made with regard to Parliamentary medical matters. All these recommendations will in due course come before the Council.

Other Business

The Committee gave further consideration to the Dental Benefit Regulations in regard to the scale of fees for anaesthetics. Strong exception had been taken to the new scale, and the matter has been before the Committee previously and was the subject of an article in the *Supplement* of September 26 1936. Representations have been made to the Minister of Health and the Dental Benefit Council for a revision of the scale, and the Dental Benefit Council promised that consideration would be given to the representations of the Association when the scale came up for consideration in April of this year. The Committee approved a statement for presentation to the Dental Benefit Council making suggestions for the revision of fees in accordance with the Association's policy.

The scale of fees at present in force for medical witnesses appearing in criminal courts is under consideration, and it is proposed to make representations for an increase in the present scale. A case is being prepared with this object in view.

Endorsement was given to a resolution of the Radiologists Group Committee that representatives of the Association should join in the deputation to the Postmaster-General arranged by the British Institute of Radiology on electrical interference with broadcasting. It was stated that this presented a serious problem for the radiologist from the point of view of his apparatus.

The report of the Select Committee on Patent Medicine Stamp Duties was considered, but it was not deemed to call for any action on the part of the Association.

King Edward's Hospital Fund for London has issued the 1937 edition of its list of pay beds for the professional and middle classes at voluntary hospitals in London. This shows an increase of 115 beds since last year, the total now being 2,112. The increase in the number of pay-beds is, of course, in addition to an extension of the accommodation for patients in the ordinary wards of the hospitals. The pamphlet gives the charges at each individual hospital. Copies may be obtained from Messrs Geo Barber and Son, Ltd., Fumival Street E.C.4 price 3d post free.

THE INSURANCE MEDICAL SERVICE WEEK BY WEEK

The Acceptance of an Insured Person

Cases arise from time to time which appear to make it desirable to give an exposition of the obvious. When an insured person brings his medical card for the first time to a doctor's surgery and the doctor receives the medical card and signs it (or it is signed on his behalf by a partner, assistant, or deputy duly authorized) the doctor immediately becomes responsible under his terms of service for the treatment of that insured person free of charge. If the patient is on another doctor's list in the same district he can only accept the patient with the consent of that doctor, or, alternatively, at the end of a quarter. Subject to these reservations the obligation to give treatment free of charge is in no way qualified by the fact that for the purposes of the quarterly count the name will not appear on the doctor's list until the beginning of the next quarter. This effect on the doctor's remuneration is compensated for by the fact that an insured person going off the doctor's list after the beginning of a quarter is included in the 'count' for the whole quarter.

It would seem unnecessary to state what is so well known to insurance practitioners generally, but the statement is prompted on reading the following extract from the report of a case heard by a Medical Service Subcommittee.

The practitioner has been under agreement with the Committee for the provision of medical attendance and treatment of insured persons since January 1919 and at present he has over 2,000 insured persons included in his list. We were therefore surprised to hear him say as he did when he attended before us that he thought he was entitled to accept fees from insured persons in respect of treatment provided during the period following the presentation to him of the medical card and the date when the registration of the acceptance is notified to him by the committee. In his letter of reply the practitioner wished the committee to believe that the action of sending in an account to the insured person concerned in this case was due to inadvertence but this could hardly have been the case if it was part of a regular practice. He told us also that this was an isolated case but we did not feel able to accept this contention which was entirely at variance with his statement quoted above with regard to the period for which he was entitled to accept fees.

'The insured person's form of medical record was, with the consent of the insured person produced to us at the hearing. The first attendance recorded by the practitioner is that on February 10, and immediately above the entry for that date is written the word "panel".' We think that this note may be regarded as a confirmation if such were needed of the practitioner's theory that he was entitled to charge fees until he received from the committee notification that the patient had been added to his list. The point which the practitioner could not explain to us was the delay in forwarding the insured person's medical card to the committee. The card was clearly received by him on January 7. He said that it was sent to the committee on January 24. Whether this was the case or not we do not know but it was certainly not received by the committee until February 2. It may be noted that the notice of the acceptance of an insured person must be sent by a practitioner to the committee within seven days of the date of acceptance.

The practitioner's contention that he was entitled to accept fees from the insured person on the footing of private treatment prior to the date when he was notified that his (the insured person's) name had been placed on his list scarcely admits of argument. It has always been held that where a medical card has been presented to and accepted by a practitioner that practitioner is under obligation to

mittee have not notified him that the insured person's name has been placed on his list. It is clear beyond controversy that the practitioner's obligation to treat the patient as an insured person arose on January 6—that is the date on which it was first represented to him that the patient was in fact an insured person.

The Insurance Committee in this case came to the conclusion that the practitioner must have been aware of the fact that he was charging fees improperly, and the practitioner was censured and a substantial deduction made from his remuneration.

Partnership with a Non Insurance Partner

At the last meeting of the Insurance Acts Committee of the B.M.A. a communication was considered from the Buckinghamshire Panel Committee raising again the question of a partnership between a practitioner who is doing insurance work and another who is not. A statement had, however, been received from the Ministry to the effect that there was no ground upon which exception could be taken to such a partnership. The question had arisen because of a suggestion from the Insurance Committee that the partner with the private practice only should agree not to charge fees to his partner's insured patients. It may be recalled that the following motion by Lancashire was referred by the 1934 Annual Conference to the Insurance Acts Committee for consideration:

That in the opinion of this Conference an arrangement whereby an insurance practitioner is in partnership with a doctor who is not on the medical list is prejudicial to the observance of the regulations governing insurance practice and must of necessity conduce to abuses in the matter of receipt of fees by insurance practitioners from patients on their lists.

The committee's view was that any abuses which could be attributed to such a partnership were of such rare occurrence that it did not feel the situation was one demanding a special regulation to deal with it. The 1935 Conference concurred in this view.

Specification for Wound Dressings

The Ministry of Health has under consideration a draft specification for wound dressings which it is proposed to include in the Drug Tariff on July 1. Subject to the concurrence of the Insurance Acts Committee and the Pharmaceutical Union the specification will be as follows:

Each wound dressing consists of a pad medicated as uniformly as possible with boric acid and fixed to a base of flesh coloured elastic cotton fabric spread evenly with a rubber adhesive compound. The adhesive compound is prepared with the best para rubber and contains not less than 20 per cent of zinc oxide. The medicated pad is fixed to the spread fabric centrally as possible so as to leave a margin of adhesive fabric on each side. The elasticity of the spread fabric is across the narrow width of the medicated pad. The medicated pad and margin of adhesive surface have a protective covering of loosely attached muslin.

Standards and sizes for the spread fabric and medicated pad are set out in detail with instructions for packing and the following directions for use:

"In the absence of any special direction by the doctor the dressing should be used as follows: (1) Cleanse the wound with plain boiled water or antiseptic solution and dry the surface. (2) Remove the protective covering from the dressing. (3) Apply the medicated pad to the wound. (4) Press the muslin covering of the dressing to the skin."

PHYSICAL TRAINING AND RECREATION BILL

The Physical Training and Recreation Bill, which has just been issued, contains the Government's proposals for increasing the facilities for physical training and recreation. The main purposes of the Bill are (a) to give fuller definition to the work of the National Advisory Councils and the Grants Committee, and of the local and regional committees which they are setting up, (b) to enable the Board or Secretary of State for Scotland to make grants to voluntary bodies and local authorities in accordance with recommendations of the Grants Committees, and (c) to widen the existing powers of local authorities.

Under the Bill it will be the duty of the National Councils to arrange for the establishment of local committees (in Scotland "regional committees"), whose functions shall be to review existing facilities and encourage and promote further and better provision in their areas to consider proposals including applications for grant put up to them, and to transmit these applications to the Grants Committees with their recommendations. The Board or Secretary of State for Scotland is empowered, in accordance with the recommendations of the Grants Committees to make grants towards the capital cost of facilities for physical training and recreation including the provision and equipment of gymnasiums, playing fields, swimming baths, holiday camps and camping sites and other buildings and premises for physical training and recreation. The words "whether as a part of wider activities or not" are used, making it clear that the benefit of grants is not restricted to accommodation or equipment for physical training or recreation in the narrow sense but extends to clubs or community centres of the activities of which such training and recreation form part. Grants towards the maintenance of facilities are payable only in exceptional cases specially certified by the Board or Secretary of State for Scotland.

Powers are also given to assist the training and supply of teachers and leaders to contribute towards the funds of national voluntary organizations and on the recommendation of the Grants Committees and with the approval of the Treasury to incur expenditure on publicity for physical training and recreation.

Powers of Local Authorities

The powers of local authorities are extended to cover not merely athletic but social or educational objects. They will thus be able to provide community centres. In order that effective use may be made of these facilities the local authority will be empowered to provide wardens, teachers and leaders. Local authorities may contribute towards expense incurred either by another authority or by a voluntary organization in providing any of these facilities. The Bill also provides simpler machinery than at present exists for the compulsory acquisition of land. A local authority (other than a parish council) which cannot acquire by agreement land for any of the purposes mentioned will be enabled to acquire land compulsorily. In order to be confirmed by the Minister of Health after local inquiry in the case of opposition. Similar extensions of powers are given to local authorities in Scotland.

Certain powers of local education authorities under the Education Act 1921 are extended. Under Section 86 of that Act local education authorities for higher education are at liberty to supply or maintain or aid the supply or maintenance of facilities for social and physical training including specific objects as centres and equipment for physical training and playing fields for persons over the age of 18 who are attending educational institutions. They will now be able to use those powers for the benefit of persons of any age who are attending an educational institution or persons attending educational institutions. They will now be able to provide as a means of recreation for children attending educational institutions as a means of voluntary organizations carrying on such work and (b) to provide holiday school camps for

attending schools or young people attending continuation classes. The Bill proposes to extend the powers under (b) so that authorities will be able to provide holiday or school camps and other facilities for social or physical training in the day or evening not only for school children and continuation class students but also for any person resident in their area.

Under existing acts the Board has power to aid by grant the expenditure of local education authorities on the training of teachers, and also to pay grants direct to the governing bodies of training colleges. The proposal that the Board should have power to provide, maintain, and aid a national college or colleges for England and Wales, which is one of the most important parts of the Government's proposals, requires legislative sanction.

BOMBAY MEDICAL COUNCIL

The following are extracts from a summary of the proceedings of the meeting of the Bombay Medical Council held on February 1, 1937.

The Council considered further the draft revised code of medical ethics and resolved (1) that it is not desirable to issue any binding rules or to insist on a rigid code which shall have the force of law but that full freedom should be retained to treat any case on its merits and (2) that further elaboration of the ethical principles which should guide members of the profession is not necessary.

The Council considered further a reference from the Medical Council of India regarding the conditions of medical practice in the French establishments in India affecting Indian nationals possessing medical degrees included in the First Schedule to the Indian Medical Council Act 1933 and resolved to endorse and agree with the following resolution passed by the Madras Medical Council on October 27, 1936.

This [the Madras Medical] Council resolves to request the Medical Council of India immediately to recommend to the Government of India to correspond with the French Government in order that registered medical practitioners in the Provincial Registers in this country may be allowed to practise in French India and in case the French Government refuses to comply with this suggestion that the Government of India may be requested by the Medical Council of India to enact suitable legislation to prevent practitioners from French India from practising in British India unless they are in the Provincial Registers.

Consideration was also given to a reference from the Medical Council of India regarding the conditions of medical practice in Portuguese India affecting Indian nationals possessing medical degrees included in the First Schedule to the Indian Medical Council Act 1933 and resolved (1) that no further action in the matter appears called for as the reciprocity at present existing between the Government of Bombay and the Government of Portuguese India has been continued but (2) that the Medical Council of India should be informed that the Bombay Medical Council would urge that the Government of Portuguese India be requested to allow all medical practitioners registered under the Bombay Medical Act, VI of 1912 to practise in Portuguese India.

In response to a request of the dean of the Nair Hospital Dental College Bombay for support in bringing a Dentists Registration Act on the Statute Book, the Council resolved that it would be prepared to assist in the preparation of a Dentists Registration Act for Bombay if a demand for such an Act was made by an organized dental profession.

This being the last meeting on which Major General E. W. C. Bradfield had to preside in view of his impending departure to take up the appointment of the Director General Indian Medical Service, Sir Temulji Nariman moved "That the Council place on record their appreciation of the cordial way in which General Bradfield had always conducted the meeting of the Council and the great help he had rendered in the disposal of the business which came before them." The motion was seconded by Sir Nasarwanji Choksi and on being put to the vote was carried unanimously. General Bradfield expressed his thanks to the Council.

Correspondence

THE VOLUNTARY HOSPITAL AND CONTRIBUTORY SCHEMES

SIR—I was interested to read your remarks in the *Supplement* to your issue of March 6 (p. 114) on hospital contributory schemes, in which you suggest that the medical staffs should receive 20 per cent of funds collected under such schemes.

Do you realize that many contributing schemes only pay to the voluntary hospitals about 70 to 80 per cent of the actual cost of treating their contributors and dependants? Is not your suggestion if adopted likely to kill the goose that laid the golden egg? It must be clear to everybody actively engaged in running a voluntary hospital that the main trouble is financial so that the more money taken out of these funds the nearer the end of the voluntary hospital system. You may ask what is the remedy? Honestly I do not know. It may be that the price of beds will have to be put up for all except the necessitous poor or the employment of a permanent paid medical and surgical staff with consulting honoraries, the hospital taking all fees which would be fixed in a ratio to the amount charged for accommodation.

This matter is of such vital importance for the saving of the voluntary hospital system that a strong joint committee of lay and medical representatives should be formed to go into the whole matter—I am, etc.

Liverpool, 8, March 24

LAYMAN

THE CAPITATION FEE

SIR,—It is a matter for great surprise that the deputation to Sir Kingsley Wood, with reference to the capitation fee for juveniles and also increase of the capitation fee agreed at once to arbitration. It would seem as if we have no power behind our arguments. I thought all G.P.s agreed to have nothing to do with juveniles for a reduced capitation fee. The present capitation fee is not even net much has to be paid for out of it.

In this district the Oddfellows and the Foresters offer 3s 6d a visit 2s 6d without medicine 2s 6d at the surgery with medicine, 1s 6d at surgery without medicine and 1s 6d medicine only. They say there is no question of long journeys as the radius is only four miles. They only pay half yearly. Now the Oddfellows is even suggesting worse terms in this district 6s a year for all ages up to 18 years. It is really time we had some unison in the profession otherwise it will be impossible to carry on. The children go to school doctors and welfare centres, maternity cases go to maternity homes, and many patients who used to attend as private patients go to hospitals. Besides all this the bad debts for those patients the doctor does attend privately are increasingly heavy. With all these losses how can a doctor manage if the capitation fee is not increased perhaps reduced also a less fee accepted for juveniles?

If the profession agrees to exclude juveniles at a certain fee is it advisable for a deputation to adopt another course? The present capitation fee is of far less value than that before the war—I am, etc.,

March 23

G.P.

SIR—The reply of the Minister of Health to the B.M.A. deputation on the question of the capitation fee was characteristic and in the light of his previous offer for juveniles not altogether surprising. It is to be hoped that his statement to the effect that a flat rate substantially below the present figure could well be justified will be immediately countered.

Such a statement shows that he must be totally out of touch with the working of an insurance practice. Our capitation fee has never been at a proper level and it has been several times lowered. Our expenses mount up and our work especially clerical work is added to to the detriment of our patient. After an expensive and long curriculum many of us find it difficult to save for our old age and as we can expect no pension there can be little thought of retirement as in Government departments. The labourer is worthy of his hire and

- 15 Thurs. Radiologists Group Committee, 2.30 p.m.
- 29 Thurs. Charities Committee

MAY

- 18 Tues. Organization Committee 2 p.m.

Scholarships and Grants in Aid of Scientific Research

Scholarships

The Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows: an Ernest Hart Memorial Scholarship, of the value of £200 per annum, a Walter Dixon Scholarship, of the value of £200 per annum, and three Research Scholarships, each of the value of £150 per annum. These Scholarships are given to candidates whom the Science Committee of the Association recommends as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention or treatment of disease. Preference will be given, other things being equal, to members of the medical profession. Each Scholarship is tenable for one year, commencing on October 1, 1937. A Scholar may be reappointed for not more than two additional terms. A Scholar is not necessarily required to devote the whole of his or her time to the work of research, but may hold a junior appointment at a university, medical school, or hospital provided the duties of such appointment do not interfere with his or her work as a Scholar.

Grants

The Council of the British Medical Association is also prepared to receive applications for Grants for the assistance of research into the causation, treatment or prevention of disease. Preference will be given other things being equal to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine.

Conditions of Award Applications

Applications for Scholarships and Grants must be made not later than Saturday, May 8, 1937, on the prescribed form, a copy of which will be supplied on application to the Medical Secretary of the Association, B.M.A. House, Tavistock Square, London, WC1. Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

Sir Charles Hastings Clinical Prize

The Sir Charles Hastings Clinical Prize which consists of a certificate and a money award of fifty guineas is again open for competition in respect of 1938. The following are the regulations governing the award.

1 The Prize is established by the Council of the British Medical Association for the promotion of systematic observation, research and record in general practice. It includes a money award of the value of fifty guineas.

2 Any member of the Association who is engaged in general practice is eligible to compete for the Prize.

3 The work submitted must include personal observations and experiences collected by the candidate in general practice and a high order of excellence will be required. If no essay entered is of sufficient merit no award will be made. It is to be noted that candidates in their entries should confine their attention to their own observations in practice rather than to comments on previously published work on the subject though reference to current literature should not therefore be omitted when it bears directly on their results, their interpretations and their conclusions.

4 Essays or whatever form the candidate desires his work to take must be sent to the British Medical Association House, Tavistock Square, London, WC1, not later than December 31, 1937. The Prize will be awarded at the Annual General Meeting of the Association to be held in July 1938.

5 No study or essay that has been published in the medical press or elsewhere will be considered eligible for the Prize and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work. A prizewinner in any year is not eligible for a second award of the Prize.

6 If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay, the decision of the Council on any such point shall be final.

7 Each essay must be typewritten or printed, must be distinguished by a motto and must be accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address.

8 The writer of the essay to whom the Prize is awarded may on the initiative of the Science Committee be requested to prepare a paper on the subject for publication in the *British Medical Journal* or for presentation to the appropriate Section of the Annual Meeting of the Association.

9 Inquiries relative to the Prize should be addressed to the Medical Secretary.

Katherine Bishop Harman Prize

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman Prize, of the value of £75 in the year 1938. The purpose of the prize, founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child bearing. It will be awarded for the best essay submitted in open competition, competitors being left free to select the work they wish to present provided this falls within the scope of the prize. Any medical practitioner registered in the British Empire is eligible to compete.

Should the Council of the Association decide that no essay submitted is of sufficient merit, the prize will not be awarded in 1938 but will be offered again in the year next following this decision and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each essay must be typewritten or printed in the English language, it must be distinguished by a motto and accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address. Essays must be forwarded so as to reach the Medical Secretary (to whom inquiries may be sent) B.M.A. House, Tavistock Square, London, WC1, not later than December 31, 1937.

Branch and Division Meetings to be Held

BIRMINGHAM BRANCH, WARWICK AND LEAMINGTON DIVISION.—Joint meeting with Rugby Division at Manor House Hotel Leamington Spa Thursday April 8 5.50 p.m. Election of Representative and Deputy Representative for the two Divisions 6 p.m. Lecture by Dr. George Bray Allergic Diseases To be followed by dinner.

GLASGOW AND WEST OF SCOTLAND BRANCH, LANARKSHIRE DIVISION.—At Royal Infirmary Glasgow Wednesday April 7, 3.30 p.m. Mr J. M. Melvin Surgical Demonstration.

HERTFORDSHIRE BRANCH, EAST HERTFORDSHIRE DIVISION.—At Cell Barnes Colony St Albans Wednesday April 7 3 p.m. Dr N. H. M. Burke Mental Deficiency Colonies.

LANCASHIRE AND CHESHIRE BRANCH, ROCHESTER DIVISION.—Joint meeting with Bury and Oldham Divisions Friday April 9 8.30 p.m. B.M.A. Lecture by Mr Geoffrey Jefferson The Surgical Treatment of Intractable Pain.

METROPOLITAN COUNTIES BRANCH, CITY DIVISION.—At Metropolitan Hospital Kingsland Road E. Tuesday April 6 9.30 p.m. Dr R. D. Lawrence The Practitioner and Diabetic Emergencies.

METROPOLITAN COUNTIES BRANCH, NORTH MIDDLESEX DIVISION.—At North Middlesex County Hospital Wednesday April 7 3.30 p.m. Clinical meeting.

METROPOLITAN COUNTIES BRANCH, SOUTH WEST ESSEX DIVISION.—At Wesleyan Schools High Road Leyton Tuesday, April 6 9.15 p.m. Mr A. J. Wylie Reminiscences of an Insurance Committee Clerk.

METROPOLITAN COUNTIES BRANCH, STRATFORD DIVISION.—At King George Hospital Ilford, Friday, April 16 3 p.m. Clinical meeting. At Educational Offices Stratford Broadway Tuesday April 20 9.15 p.m. Dr Henry Semon Cutaneous Allergy.

NORTH OF ENGLAND BRANCH, GATESHEAD DIVISION.—At Whinney House Tuesday, April 20 Clinical evening.

NORTHERN IRELAND BRANCH.—At Whitla Medical Institute College Square North Belfast Thursday April 8 4.10 p.m. Meeting of a subcommittee of the Branch and members of the Branch to consider the maternity services in Northern Ireland.

NORTHERN IRELAND BRANCH, BELFAST DIVISION.—Thursday April 15 4.30 p.m. Dr G. C. Anderson (Medical Secretary). The B.M.A. and the Future of Medical Practice. All members of the Northern Ireland Branch are invited.

NORTH OF ENGLAND BRANCH, NORTH NORTH MERLAND DIVISION.—At Belford Wednesday April 21 Consideration of programme for summer and autumn months.

NORTH OF ENGLAND BRANCH, INVERNESS DIVISION.—At Royal Northern Infirmary Thursday April 8 4 p.m. Appointment of Representative and Deputy Representative to the B.M.A. Annual Meeting in July. Consideration of adoption of resolution under ethical rules of Division.

SOUTH WALES AND MONMOUTHSHIRE BRANCH.—At Newport Thursday April 8 Branch meeting.

SHIRLEY BRANCH, CROYDON DIVISION.—At Shirley Park Hotel Thursday April 8 Annual Dinner and Dance.

SURREY BRANCH, RICHMOND DIVISION.—At Richmond Royal Hospital Friday April 9 3 p.m. Clinical meeting.

SUSSEX BRANCH, HASTINGS DIVISION.—At Queen Hotel Hastings Tuesday April 6 8.30 p.m. Mr Gavin Livingstone Allergy.

SUSSEX BRANCH, WEST SUSSEX DIVISION.—At Worthing Hotel Thursday April 8 3 p.m. Clinical meeting.

YORKSHIRE BRANCH, BRADFORD DIVISION.—Wednesday April 7 Cinematograph Film The Preparation of Vaccines.

Meetings of Branches and Divisions

CYPRUS BRANCH

At a meeting of the Cyprus Branch held at Nicosia on March 9 Dr GOKTER presented two cases of eye affections and Mr CHARLES ARBUTT lectured on "Some Points in Medical Jurisprudence." Nineteen members and friends were present.

BEDFORDSHIRE BRANCH

At a meeting of the Bedfordshire Branch held at Luton on March 9 the film of the B.M.A. World Tour was exhibited and commenced upon by Dr J. W. BONS. An interesting address of members and their ladies expressed their appreciation of Dr BONS' kindness in arranging the meeting.

DORSET AND WEST HANTS BRANCH, BURNLEY DIVISION.

At a meeting of the Burnley Division held at Burnley on February 24 with Dr J. C. A. NORMAN in the chair Dr NORMAN referred to the death of a member of the Division Dr HENRY HALL and the members stood in silence for a minute in respect to his memory. Dr NORMAN then said that he felt sure that a large number of the members present at a meeting of the very day would be able to tell him that they had been on the same boat.

Dr James MAXWELL read a paper on 'Lung Abscess.' The lecturer said that by lung abscess he meant a non-tuberculous suppuration with cavity formation in lung tissue, this definition excluded suppuration in bronchiectatic cavities. The causes were (1) Lesions of the respiratory tract (2) abdominal conditions (3) peripheral septic conditions (4) lesions of the nervous system and (5) the primary group. There were two theories of the causation of lung abscess (1) that infection was by aspiration (2) that infection was borne by the blood stream. As regards the clinical picture in a certain group of cases there were few or no symptoms whatsoever. In another group there might be definite respiratory symptoms. The sputum might be pure pus sometimes there was haemoptysis and often pain. Signs were obvious if the abscess was close to the chest wall but they might be very few if the abscess was deep seated. Bronchopneumonia empyema pyopneumothorax septic endocarditis and cerebral abscess were the most frequent complications.

Speaking of special investigations to make certain of a diagnosis the lecturer said the examination of the sputum should never be neglected and bronchoscopy was absolutely essential also. He related how on more than one occasion a pea nut had been discovered by bronchoscopy and how its removal had cleared up symptoms very rapidly. Ray examination was very useful but lipiodol did not help unless an abscess cavity communicated with the bronchus and in those cases the diagnosis was never in doubt. Needling should never be done to locate an abscess for fear of infecting the pleural cavity.

As regards treatment Dr Maxwell said that prevention was of the utmost importance and advised the routine inhalation of CO₂ after operations. In influenza patients where there were any lung symptoms injections of quinine were helpful. All cases should be treated medicinally for two months, as many cleared up without surgical intervention. Artificial pneumothorax was he thought a dangerous procedure and if an operation was decided upon then a two stage procedure should always be carried out.

An interesting discussion then followed, in which Drs J. DIXON GREEN, B. W. GOLDSTONE, A. KINSY, MORGAN, R. V. FACEY, SIMMONS, W. BLICH, A. R. N. MCGILLICUDDY, N. F. ADENEY, A. BASIL ROOKE, and S. A. MONTGOMERY took part. A very hearty vote of thanks was then accorded Dr Maxwell for his interesting and instructive lecture and to Dr W. R. PRATT for operating the lantern.

HERTFORDSHIRE BRANCH, BARNET DIVISION

At a meeting of the Barnet Division, held at Old Ford Manor Golf Club on March 9 with Dr N. G. THOMSON in the chair Dr C. E. LAKIN gave a talk on Toxaemia of Pregnancy. He illustrated his remarks with a case and then went on to give an explanation of the modern conception of jaundice. Several curious phenomena were discussed including a jaundiced lactating female who never showed stained milk unless mastitis was present. A jaundiced bronchitic had normal sputum but a patient with pneumonia and jaundice showed stained sputum. The meeting closed with a hearty vote of thanks to Dr Lakin for his address.

KENT BRANCH, EAST KENT DIVISION

A meeting of the East Kent Division preceded by an informal dinner was held at Canterbury on March 19 with Mr W. I. C. WYNNE in the chair.

Dr A. M. WATTS was elected representative and Dr F. W. CHEESE deputy representative in the Representative Body.

Dr CONRANT PENDER read an interesting paper on "The Organization and Work of the County Public Health Laboratories." After a lively discussion the meeting closed with a hearty vote of thanks to Dr Pender for his address.

LANCASHIRE AND CHESHIRE BRANCH, PRESTON DIVISION

At a joint meeting of the Preston Division and the Preston Medical-Ethical Society held at Preston Royal Infirmary on March 16 Dr JOHN I. WATKINSON (Mar. 1937) gave an address on "Toxic Anaemias." Dr WILKINSON dealt as fully as time would permit with his very wide subject. There was a large and attentive audience and an interesting discussion took place.

SOUTH WALES AND MONMOUTHSHIRE BRANCH, SOUTH GLAMORGAN AND BLACKBROOK DIVISION

At a meeting of the North Glamorgan and Blackbrook Division held at Pen-y-dalen on March 16 Dr WILLIAM EVANS delivered a B.M.A. Medical Association Lecture on "The

Diagnosis and Treatment of Heart Failure In its manner of delivery and in its subject matter the lecture was greatly appreciated. A discussion followed in which several members and guests took part. A supper followed.

UNITED PROVINCES BRANCH

At a clinical meeting of the United Provinces Branch held at Lucknow on January 29, with Lieut-Col R S TOWNSEND I.M.S. in the chair, cases were demonstrated by Captain K S NIGAM. One was a case of suspected intracranial neoplasm about the pituitary region which had been approached by Frazier's transfrontal route. The patient subjectively appeared much improved three weeks after the operation, his severe headaches and giddiness had disappeared, and he took more interest in life. The wound healed up uneventfully.

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE

Section of Orthopaedics—Tues 5.30 p.m. (Cases at 4.30 p.m.) Film by Mr K H Priddy Treatment of Fractures of the Neck of the Femur
Section of History of Medicine—Wed 5 p.m. Dr P H Manson Bahr, Historical Landmarks in Tropical Medicine
Section of Surgery—Wed, 8.30 p.m. (Specimens on view from 5 p.m.) Pathological Meeting
Clinical Section—Fri, 5.30 p.m. (Cases at 4.30 p.m.) Annual General Meeting Election of Officers and Council for 1937-8
Section of Epidemiology and State Medicine—Fri 8.15 p.m. Paper by Prof. Claus Jensen (Copenhagen) Active Immunization against Diphtheria by the Combined Subcutaneous and Intranasal Method

MEDICAL SOCIETY OF INDIVIDUAL PSYCHOLOGY—At 11 Chandos Street W. Thurs 8.30 p.m. Dr H Crichton Miller Puberty and Adolescence

WEST LONDON MEDICO-CHIRURGICAL SOCIETY—At De Vere Hotel Kensington Road W. Fri 8.30 p.m. Discussion Sudden Death To be opened by Dr Edwin Smith, Dr B T Parsons Smith and Dr T Skene Keith

WEST KENT MEDICO-CHIRURGICAL SOCIETY—At Miller General Hospital, Greewich S.E. Fri 8.45 p.m. Debate That Contraception is to the Advantage of Humanity. Proposer Dr Jane Hawthorne, seconder, Dr Margaret Green. Mover of negative Dr Jaquet M C Gray, seconder of negative, Dr F A Beattie

WEEKLY POST-GRADUATE DIARY

BRITISH POST-GRADUATE MEDICAL SCHOOL Ducane Road W.—Daily 10 a.m. to 4 p.m., Medical Clinics Surgical Clinics and Operations Obstetrical and Gynaecological Clinics and Operations Mon 2.30 p.m. Dr C W Buckley Arthritis Wed 12 noon Clinical and Pathological Conference (Medical) 2.30 p.m. Dr King Acidosis and Alkalosis 3.15 p.m. Clinical and Pathological Conference (Surgical), 4 p.m., Dr J E H Roberts Surgery of the Chest 4.30 p.m. Dr W E Gye, Experimental Cancer Research Thurs 12 noon Clinical and Pathological Conference (Obstetrics and Gynaecology), 2.30 p.m. Dr Duncan White Radiological Demonstration 3.30 p.m., Mr A K Henry Demonstrations on the Cadaver of Surgical Exposures 3.30 p.m., Mr Clifford White Benign Neoplasms of Uterus Fri 2 p.m., Operative Obstetrics 3 p.m. Department of Gynaecology Pathological Demonstration

CENTRAL LONDON THROAT NOSE AND EAR HOSPITAL Gray's Inn Road W.C.—Mon to Fri 4.30 p.m. Course in Methods of Examination and Diagnosis Fri 4 p.m., Mr A Lowndes Yates Familial Sinusitis

NATIONAL HOSPITAL FOR DISEASES OF THE HEART Westmoreland Street W.—Tues 5.30 p.m. Dr Maurice Campbell Paroxysmal Tachycardia

St JOHN CLINIC AND INSTITUTE OF PHYSICAL MEDICINE Ranelagh Road S.W.—Fri 4.30 p.m. Dr G T Calthorpe Demonstration of X Rays of Conditions Simulating the Rheumatic Diseases

was particularly obvious in studying physical development that the original degree of dwarfing was unimportant if a ready increase in height took place when therapy was instituted. The results of treatment over the whole period make it clear that the first two years of treatment were of critical importance, that the entire gain in developmental quotient was accomplished during that time and that the maximum quotient once reached could be maintained indefinitely on thyroid treatment. Although generalizations cannot be founded with confidence on six cases the authors have clearly made a contribution of real clinical value if only in indicating a line for further study and have properly emphasized the importance of a knowledge of behaviour patterns in infancy in the advance of paediatrics.

PREVENTION OF TUBERCULOSIS

King George VI has consented to become Patron and H.R.H. the Duke of Kent President of the National Association for the Prevention of Tuberculosis. It was in 1898 that King Edward VII as Prince of Wales, founded the Association and became its first President. On his accession to the throne he became Patron, and was followed by King George V and King Edward VIII. The Duke of Kent succeeds the Prince of Wales as President. The National Association for the Prevention of Tuberculosis has led and unified voluntary effort against tuberculosis in this country for thirty nine years, instructing public opinion and stimulating public interest in the means of prevention and cure. Its annual conferences are held alternately in London and other centres; it also initiates special inquiries for the study of vital problems. The chairman is Sir Robert Philip who fifty years ago established in Edinburgh the first tuberculosis dispensary in the world. This year's conference will take place from July 1 to 3 in Bristol; the chief subjects for discussion being propaganda and publicity methods, preventive institutions with particular reference to open air schools and equipment and activities of a tuberculosis dispensary. The names of delegates and of private individuals wishing to attend should be sent to the acting secretary-general N.A.P.T. Tavistock House North Tavistock Square W.C.1.

SIZE OF THE PROSTATE

The size, weight and shape of the prostate vary much. Atrophic glands in the adult may weigh as little as 10 grammes and the weight of large hypertrophied glands may be as much as 300. The average weight of the normal adult gland has been stated by various authorities to lie between 20 and 25 grammes. A recent study of the prostate by careful dissection of the specimens taken from 100 consecutive necropsies has been made by M. van Buren Teem¹ working as a Fellow in medicine at the Mayo Foundation at Rochester, Minnesota. The average weight in Teem's series accorded closely with the normal values of 20 to 25 grammes. As the prostates studied had not been a factor in the cause of death the series did not

contain many hypertrophied glands. It was found that in adults atrophic glands (those weighing for example 10 grammes which is the normal weight in a boy aged 12) are usually associated with atrophic testes such as are seen in association with hypopituitarism. An interesting point elicited was the fact that a large prostate may be symptomless; for instance one prostate weighed 139 grammes yet it came from a subject in whom there had been no history of significant genito-urinary symptoms and in whom at the necropsy there was no evidence of urethral obstruction. It would appear that urethral obstruction depends more upon the manner of the enlargement than upon its degree. The author points out that as the prostate enlarges it changes from a rather flattened chestnut shape to one which is more spherical and the chief dimensional alteration is in the antero-posterior measurement or depth of the organ. He has prepared tables by which the weight of the gland may be calculated from its measurement if the antero-posterior side to side and vertical measurements expressed in centimetres are multiplied together and by a factor 0.666 the weight of the gland is obtained with a reasonable degree of accuracy. This formula may prove useful in the post-mortem room since the requisite measurements can be readily made without dissecting out and weighing the gland.

ADVISORY COMMITTEE ON NUTRITION

The first report of the Ministry of Health's Advisory Committee on Nutrition is published to day (H.M. Stationery Office 1s net). The reference to the committee was 'to inquire into the facts quantitative and qualitative in relation to the diet of the people and to report as to any changes therein which appear desirable in the light of modern advances in the knowledge of nutrition'. The chairman is Lord Lute and the medical members are Dr G. F. Buehan, Professor E. P. Cathcart, Dr J. Alison Glover, Dr J. M. Hamill, Sir F. Gowland Hopkins, Dr Donald Hunter, Professor E. Mellanby, Sir John Boyd Orr. The late Mrs. Chalmers Watson M.D. was an original member of the committee and Dr T. W. Wade was added soon after its appointment in May 1935. The present report gives the results of a preliminary survey of the whole field. The committee is very far from having completed its investigations and in several directions has initiated large scale inquiries which are only just beginning. Its purpose now is to outline the nature of the problems and the general picture it has formed of the present position. The report is a document of over 50 pages that does not lend itself to brief summarization and we must therefore defer our descriptive account of it to a later issue merely noting meanwhile the emphasis laid in Part VI on the nutritive value of milk and milk products. 'From the health standpoint there is no other single measure which would do more to improve the health, development and resistance to disease of the rising generation than a largely increased consumption of milk especially by mothers, children and adolescent.'

We deplore the fact that there is a deficiency of milk in the diet of large sections of the population.

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

THE HORMONE TREATMENT OF SOME DISORDERS OF PREGNANCY

BY

T. N. A. JEFFCOATE, M.D., F.R.C.S. ED.

PART II

Missed Abortion, Carneous Mole, and Intra uterine
Death of the Foetus

These interesting conditions are essentially the same in so far as the ovum or foetus dies but remains *in utero* because the normal stimulus to uterine action is lacking. Oftentimes evacuation of the uterus eventually takes place spontaneously but occasionally weeks or months elapse without there being any sign of the onset of expulsive uterine contractions. In such cases artificial evacuation of the uterus is indicated and it is for this purpose that oestrogenic hormone is useful. The ordinary mediocrinal induction generally fails because the uterus is not sufficiently sensitive to respond. The continued administration of oestrogenic hormone however increases uterine activity to such an extent that even if evacuation does not take place spontaneously the uterine contents are at once expelled when oxytocic drugs are given. The following technique is successful in at least 80 per cent of cases.

Oestradiol benzoate 40 000 international benzoate units (200 000 international units) should be injected intramuscularly every eight hours for eight days (unless evacuation takes place before the elapse of that time). On the fifth day quinine and pituitary induction using the technique outlined previously should be carried out. The administration of oestrus producing hormone should be continued throughout and if the first attempt at mediocrinal induction fails the quinine and pituitary should be repeated as before on the eighth or ninth day. Only on the rare occasions when the uterus fails to respond to this treatment is it necessary to institute operative measures. In actual practice the oestrogenic hormone frequently brings about the desired result without further uterine stimulants being necessary. This is especially true if the pregnancy is far advanced and the foetus has been dead for a relatively short period of time. This form of treatment is of no value for incomplete abortion. In this condition the residual fragments of placenta or membranes are usually adherent to the uterine wall.

Excessive Vomiting and Toxaemia of Pregnancy

For many years past one of the theories of the aetiology of hyperemesis gravidarum has depended upon a supposed defective function on the part of the corpus luteum and acting on this supposition many clinicians have prescribed corpus luteum tablets for this distressing complaint. The impotence of such tablets from the hormonal standpoint has already been emphasized. Since the theory on which the treatment is based has never been substantiated by pathological evidence the administration of even standardized preparations of progesterin is not recommended as a means of controlling pernicious vomiting.

It has recently been suggested that in cases of pregnancy toxaemia there is a relatively excessive amount of prolactin and a deficiency of oestrin in the urine. In view of this the administration of oestrogenic hormone for toxaemia of pregnancy is already advocated in commercial literature. The evidence upon which this view of the pathogenesis of toxaemia is based is flimsy and unconvincing and this form of organotherapy is not advised.

Uterine Inertia

USE OF OESTROGENIC HORMONES

Since the activity of a uterus is primarily dependent on the effect of oestrin many cases of uterine inertia in labour are probably due to a defective supply of this hormone. This suggestion is conjectural since it has never been confirmed or disproved by hormonal estimations. The deficiency in oestrogenic factors is not necessarily absolute but may be relative. In other words they may be present but in an inactive state in the blood stream. This theory has led to a trial of oestrogenic hormone therapy for uterine inertia. Most writers report poor results—on a very small series of cases. In my experience the results are variable some disappointing and others remarkably good. This is to be expected in view of the numerous and widely different possible causes of defective uterine action. No definite subdivision of cases is yet possible but it would appear that the results are poor if the inertia is due to emotional influences, local lesions of the uterus, disproportion or malpresentations. Moreover the injection of oestrogenic hormone rarely evokes a response in the presence of conditions such as occipito-posterior position in which slow dilatation of the cervix and weak contractions in the early stages of labour are beneficial to the patient and the inertia is physiological in type.

Primary inertia is more amenable to this treatment than is secondary and 50 per cent of all cases of uterine

size that this form of therapy is at present on trial only it has, however, the great advantage of being free from all the dangers that are associated with the administration of other oxytocic substances, and no harm to either mother or child can follow its use. The occasional good results justify its extended employment. Here again hormone therapy should not replace the more established methods of treatment; it should be regarded as additional treatment and should be given when the patient has been rested and refreshed by the use of morphine, which still remains the first and best line of attack in uterine inertia.

From what has been said it is clear that oestrogenic hormone therapy also opens up new possibilities with regard to prophylaxis against inertia. It may prove even more valuable in this respect. When the history of inertia in previous labours or the detection of an atonic uterus ante natus makes the expulsive capacity of a uterus suspect, 20,000 international benzoate units (100,000 international units) of oestrin should be injected intramuscularly twice daily for two or three weeks before the expected date of delivery.

USE OF POSTERIOR PITUITARY HORMONE

As prophylaxis against inertia 5 units of posterior pituitary should be injected twice daily for two weeks before the expected onset of labour, this treatment is attended with happy results and is devoid of risk. But when labour has started and inertia is established the administration of this hormone requires the utmost caution. The effect of even small doses may be so pronounced that the uterus cervix, or other soft maternal tissues may be ruptured; moreover the foetus is likely to die from interference to the placental circulation. Only when the position of the foetus is normal and when the presence of even mild disproportion is excluded should the use of posterior pituitary extract be contemplated. Its application is occasionally indicated for patients suffering from accidental ante partum haemorrhage complicated by defective uterine action. The dose should never exceed 2 units initially and after its injection the medical attendant should remain with the patient until delivery is complete.

Only rarely is the use of such a powerful oxytocic substance required and its margin of safety is so small that many obstetricians are coming to regard its employment during labour as unjustified in all circumstances. It is, however, stated that its dangers are somewhat decreased if it is applied intranasally rather than parenterally.

Post-partum Haemorrhage

During the third stage of labour the injection of pituitary extract is dangerous because of its propensity for producing hour glass contraction of the uterus; it should never be used for third stage haemorrhage nor to hasten placental separation. But for bleeding occurring after delivery of the placenta this hormone is a life saving principle and its administration should never be neglected. The intragluteal injection of 5 or 10 units is as a rule sufficient but 2 units intravenously or 5 units into the uterine muscle (via the abdominal wall) exert a more rapid and certain oxytocic effect and should be given when control of the haemorrhage is difficult or delayed.

Delayed Involution

When after abortion or labour involution is slow and the lochia profuse and particularly if there is reason to suspect the retention of blood clot or small pieces of membrane in the uterus 5 units of posterior pituitary extract should be injected intramuscularly twice daily for a few days.

Tonic Uterine Contraction

Tonic uterine contraction may involve the whole of the upper segment, as in obstructed labour or on the other hand, it may affect a strictly localized area of one or other segment of the uterus and appear in the form of a contraction ring. These serious obstetrical complications demand the immediate institution of measures designed to relieve spasm and to reduce uterine tone. Morphine and general anaesthesia do not always have the desired effect, and now that it is claimed that progesterin when given in large doses quickly exercises an inhibitory action upon the human uterus (puerperal), this hormone should be tried in such conditions. So far I have failed to influence the uterine contractions of normal parturition with large doses of progesterin (20 international units), but this does not necessarily mean that pathological uterine spasm will not respond favourably to such treatment.

Another endocrinous preparation sometimes advised for tonic uterine contraction is 5 minims of adrenaline hydrochloride 1 in 1,000. The internal secretion of the suprarenal has very varied effects on uterine muscle and whereas in some patients it temporarily suppresses contractions in others it produces an opposite response. This treatment is therefore of small value.

The Relief of "After-pains"

Uterine contractions during the first week after delivery are, on occasion so painful as to cause the patient considerable distress. It is reported that 1 rabbit unit of progesterin by inhibiting the uterus, relieves such pain within fifteen minutes in nearly 90 per cent of cases. It is, moreover, rarely necessary to repeat the injection. I have no personal experience of this use of progesterin, and it is extremely doubtful whether it is wise to allay muscle contractions whose purpose is to expel blood clot and necrotic shreds of decidua and membrane from the uterine cavity. Such contractions are essentially protective in character and should be encouraged rather than suppressed, the injection of 0.5 ccm of posterior pituitary extract frequently relieves after pains since it replaces irregular uterine spasm by rhythmical strong contractions.

Disorders of Lactation

Although breast development is brought about by oestrogenic and corpus luteum hormones the secretion of milk can only be effected through the agency of the anterior lobe of the pituitary—by a special hormone designated prolactin. This hormone has been given to patients in whom the supply of milk was deficient; the dose so far recommended on empirical grounds is 150 bird units followed by 100 bird units in twelve to twenty four hours. Although the rationale of this method is sound the reported results are so far discordant and the usefulness of the hormone in this sphere is at present unproved.

The oestrogenic hormone, while stimulating breast development inhibits the secretion of milk by its action on the pituitary gland. Hence in patients in whom lactation is not desirable the discomfort of engorged and painful breasts is theoretically avoidable by injections of oestrogenic hormone. The dose advised is 10,000 international benzoate units (50,000 international unit) of oestrogenic hormone on three successive days beginning as early as possible after delivery. Although good results are reported for this form of organotherapy I have failed to notice beneficial effects with this dosage. Possibly larger amounts of hormone continued for a longer period and followed eventually by a gradual reduction in the oestrin supply would be more efficacious. Such a technique has a more scientific basis. It is however of no

to question whether the discomfort of repeated intramuscular injections is preferable to the pain of engorged breasts especially since the latter is of short duration and may readily be relieved by other well recognized methods of treatment.

Dangers of Hormone Therapy

So far as is known at present the administration for short periods of time of the largest doses of oestrogenic, corpus luteum, and gonadotropic hormones is free from risk. But posterior pituitary extracts differ from preparations of the other hormones in that they are extremely dangerous unless prescribed with caution. The possibility of the production of ruptured uterus and tonic uterine contraction by means of these agents has already been discussed. In addition it should be remembered that most extracts contain a vasopressor factor and their employment is therefore contraindicated in patients suffering from cardiac disease or toxæmia of pregnancy. Cases are recorded in which the onset of eclamptic fits appears to have been due to such preparations. Moreover some patients show an idiosyncrasy to pituitary extract and after receiving it may collapse and present the signs of so-called 'pituitrin shock'. If this occurs in a patient already suffering from loss of blood the issue may be fatal. It is probable that many cases of obstetric shock would be more correctly diagnosed 'pituitrin shock'.

In view of the above disadvantages and dangers many authorities now advise the use of the isolated oxytocic fraction of the posterior pituitary lobe (for example pitocin Parke Davis and Co) rather than preparations containing both oxytocic and vasopressor factors. Pitocin possesses a further advantage since its administration does not produce a refractory phase in the uterus, whereas injections of extracts such as pituitrin render the uterus incapable of responding to a second application of the same substance until half to one hour has elapsed. Nevertheless pitocin is equally dangerous when given in labour although it has a less powerful oxytocic action than have the 'mixed' extracts of the posterior hypophysis.

Conclusion

The value and limitations of posterior pituitary hormone therapy are clearly defined, but it is difficult to assess the merit of other forms of organotherapy in the obscure functional disorders of gestation. Any experiments or results must of necessity be uncontrolled and only by the collection of large numbers of cases can an estimate of the worth of any particular method be made. Nevertheless progress is being made and already hormones are proving of definite clinical value in some of the conditions mentioned. Their use however is strictly limited and must always be guided by scientific principles: the prescription of hormones empirically or with a faulty technique merely brings organotherapy into disrepute. Moreover the therapeutic application of endocrinology is still handicapped by the expense of most preparations and by the lack of accurate knowledge regarding the absorption, utilization, inactivation, destruction and excretion of the hormones in question.

SCIENTIFIC RESEARCH IN INDUSTRY A YEAR'S WORK

The Advisory Council of the Department of Scientific and Industrial Research, of which Lord Rutherford is chairman, directs attention in the Department's annual report (Cmd. 5350 H.M. Stationery Office 3s.) to important developments in the outlook of industry in this country. The last five years have witnessed the fruition of the policy adopted by several large industrial undertakings of setting well balanced teams of research workers including chemists, physicians, engineers, and where necessary biologists to solve a particular problem to develop a new product. The future the report continues, no longer lies with industries content to make sporadic advances at the call of the brilliant individualist; co-operation, team work, and an extensive organization on the technical side are essential for success. For this reason the Department attaches great importance to the development of the co-operative research associations formed under the scheme launched in the early days of its existence.

Savings in the Milk Industry

Valuable work is being done by the Department with its co-operation of the Milk Marketing Board on the purification of waste waters and effluents from milk depots, creameries, and condensed milk factories. Two different methods have been worked out and shown to be successful on a large scale by which the polluting character of milk washings can be reduced by 99 to 97 per cent respectively. Investigations have also drawn attention to the losses of milk, cream, whey, etc. carried away in the waste waters. It has been shown that the waste from this cause can be reduced by nearly three million gallons a year. At the low wholesale price of 5d a gallon for milk for manufacturing purposes this means a saving of about £50,000 a year to the industry. Five per cent of the total quantities of by-products—whey, skimmed milk, etc.—is frequently lost at present in the waste waters. This loss can be reduced to about 2 per cent. The suggestions put forward for reducing these wastes have already been adopted at several factories.

Storage of Food

At the Low Temperature Station, Cambridge, the effect of radiation from radio-active substances in destroying bacteria is being studied in connexion with the storage of meat. Methods of storing eggs in different concentrations of carbon dioxide are being tried out on a large scale. A high concentration of say 60 per cent prevents attack by mould and gives an excellent yolk but a very fluid white. Experiments have been made on the 'gas storage' of pears. British pears have been stored in refrigerated chambers with the atmosphere

the right amount (0.1 to 0.15 per cent) of sodium carbonate. The storage of flour is being studied by the Flour Millers Research Association. It has been found that during storage the bacteria content diminishes to a small value while the fungi content rises to very high values.

Better-fitting Boots and Shoes

The outstanding development in the work of the Boot and Shoe Research Association has been the start of what is called for brevity walking research. Most people have suffered from shoes which seemed to fit all right in the shop but after being worn some time have developed uncomfortable creases and folds which pressed on the foot and caused the growth of corns and other troubles. In order to present manufacturers with the means for designing better fitting shoes the Research Association is making careful records of the way in which people walk. A moving platform or treadmill is used on which a person can walk without moving away from a particular point. While walking thus a cinematograph record is made of the movements of the foot and this is afterwards analysed. Records are also being made by electrical thermometers of the skin temperature of the feet when wearing different types of shoes. The gaits of various individuals and the effect of different kinds of shoe upon them are also being investigated and records are being obtained which show the period of contact with the ground of the several parts of the foot. The results suggest that some shoes are much more likely to interfere with the normal gait than others and this is throwing light upon correct shoe design and construction.

Health and Hospitals

Many of the activities of the Department have a more or less direct connexion with public health. Besides an investigation on the problems of sound proof buildings tests have been carried out at the National Physical Laboratory with a view to the reduction of noise from aircraft engines, large electrical transformers, road drills and traffic. An investigation has also been begun on the production of static electrification in operating theatres of hospitals. Some of the anaesthetics in common use are of an explosive character and the possibility of the production of electrostatic charges and the risk of their ignition by sparking is one which cannot be neglected. At the request of the Home Office a preliminary examination has also been undertaken of the risk of ignition of sparks due to static electrification in dry-cleaning works. Methods for detecting in the atmosphere small quantities of poisonous gases commonly occurring in certain industrial processes have been worked out.

Researches for the Dental Board on dental amalgams have been completed during the year. The results show that the composition of the alloy used in making the amalgam must lie within very narrow limits if the dentist is to produce fillings which will continue to fill cavities without contraction. The precautions which must be observed by the dentist in preparing the amalgam have also been established. The conditions both of manufacture and use of materials for amalgam fillings have been determined as the result of an extended series of experiments in which the changes of volume at mouth temperatures have been measured sometimes over long periods.

Interesting physical work has been carried out in connexion with radium treatment of diseases under the auspices of the Radium Beam Therapy Research Board. The strength of the radiations from a specially designed radium unit with which various radium "skin distances" can be obtained have been measured in a water phantom, a celluloid vessel containing water and giving the same scattering and absorption effects as a human body. By co-operation between the medical staff and physicists means have been developed for accurately measuring and controlling tissue dosage. Another investigation is in progress on the weak radiations which may reach distant parts of a patient's body during treatment. These radiations it is believed may be of importance in constitutional effects of radium treatment—for example blood changes and general health. The method used is to measure the electricity produced (ionization) in air gaps in a laminated celluloid model of the body.

HEARING AND SPEECH IN DEAF CHILDREN

Dr Phyllis Kerridge's Report

The Medical Research Council has just issued a report on the hearing and speech in deaf children which is without doubt one of the most important and valuable contributions on the subject yet made in this country. The author is Dr Phyllis M. T. Kerridge of the physiological department of University College London. Dr Kerridge, in co-operation with Dr A. G. Wells has conducted investigations in the special schools for children with defective hearing in London at which between 500 and 600 day and residential pupils are educated. With a school population of this size consisting of children with a wide variety of hearing defects unusual facilities are offered for an investigation of this kind and Dr Kerridge has made the most of her opportunities. Nearly half the children were born deaf. Roughly two thirds of the cases of acquired deafness—usually incurred before school age—were due to middle-ear disease, which in about half the cases was a complication of a specific fever, generally measles or scarlet fever.

Methods of Testing

In an exhaustive account of the various methods of testing hearing Dr Kerridge shows that there is a difference of about 20 db (decibels) between the zero of the pure-tone and gramophone audiometers over the speech area—that is a reading of 30 db loss of hearing when tested with the gramophone audiometer is equivalent to one of 50 db with the pure tone audiometer. She disposes of the objection put forward that in testing by air conduction with the pure tone audiometer the sound is conveyed to the inner ear partly by bone by using a cap of spongy rubber to cover the periphery of the receiver so that no transfer of sound by bone could occur, further by testing with and without the rubber cap there was no difference in the results. Attention is drawn to the fact that a pure tone audiometric test gives a very good indication of the type and the cause of the deafness. Four main types of audiometric curve are considered. That one pathological process can be associated with more than one type of curve is proved by the study of those children with different types of curve for the two ears. Measurements of hearing in normal children with the pure tone audiometer gave no indication that the zero lines of the audiometer for either air or bone conduction were inapplicable to children. These results showed the limits of individual variation as 20 db for air conduction, and 20-40 db according to pitch for bone conduction. The relationship of speech to deafness and other factors is dealt with. Dr Kerridge found only 3 per cent of the children with no detectable hearing at any pitch.

The Use of Magnified Sound

Part II of the report deals with an experiment with magnified sounds carried out in co-operation with Dr A. G. Wells. Magnified sound has been employed both in this country and abroad for some years in the education of the deaf but the important thing in this experiment was that an attempt was made to assess the benefit obtained by a certain number of children, particularly in the production of normal sounding speech. Accordingly an experimental class was arranged in each of the special schools. Each class was divided into two groups of children, one being referred to as experimental (those children using sound magnification), and the other as control (those not using sound magnification). Each experimental child was matched as nearly as possible with a control child. The teachers were told that the method of education of the class for a year was to differ from the usual only in that

Hearing and Speech in Deaf Children. By Phyllis M. T. Kerridge. Med. Res. Coun. Spec. Rep. No. 221. H.M. Stationery Office. (2s.)

the experimental children should be allowed to hear as far as they were able to do so with the instrument provided while the control children should not. No special tuition was to be given to the experimental children either in speech training or in interpretation of what was heard. The experimental children would doubtless have profited much more had they had the help of special tuition especially as to many the experience of hearing was almost or entirely new but the benefit would then have been impossible to assess for special tuition alone even by ordinary methods would have produced a benefit against which there would have been no standard.

Since under the rules of the experiment little or no individual work was done by any child of either group any resulting benefit from the experiment has been a minimal one because of the restrictions. The experimental period was one year and the instrument used was the group hearing aid made by the Multitone Electric Company. Gramophone recordings were taken of each child's speech at the beginning and at the end of the year by the Marguerite Sound Studios using the cellulose acetate process. The results of the experiment showed that (1) twenty-one children (44 per cent) had profited from the use of the amplifier considerably and in many ways (2) nine children (19 per cent) had gained some benefit mainly in improved speech (3) twelve children (24.5 per cent) had been able to appreciate rhythm in speech but nothing else (4) six children (12.5 per cent) had not benefited at all. The improvements in speech were confirmed by the gramophone records.

While nearly half the experimental and control children made equal progress in general school subjects during the year about three times as many of the experimental children made more educational progress than their control partners. Further it was estimated that about three-quarters of the children in the London schools for the deaf would benefit at least in speech from the educational use of sound amplifiers and many of them in several other ways as well.

WORLD CONGRESS ON MENTAL HYGIENE

We are asked to announce that the second World Congress on Mental Hygiene will take place in Paris from Monday July 19 to Friday July 23 1937 under the auspices of the French League for Mental Hygiene. Scientific sessions will be held in the morning and afternoon and a number of visits to mental institutions clinics etc. are being organized as well as tours before and after the meeting. The first World Congress took place at Washington in 1930 and the date for the second has been fixed so as to coincide with the Paris International Exhibition.

As attendance is not limited to members of particular organizations or official delegates but is open to all interested in mental hygiene it is earnestly hoped that members of the medical profession in this country will participate in a congress at which a large number of subjects within the wide field of mental hygiene will be discussed. The enrolment fee for medical members is 125 fr (25s). Copies of the preliminary programme and all particulars may be obtained on application to the Secretary the National Council for Mental Hygiene 76-77 Chandos House Palmer Street London S.W.1 with whom registrations for the Congress should be placed as early as possible.

In view of the attention which is being devoted by local authorities to the education of the blind from London the Council of the Royal Sanitary Institute has arranged courses of training in the work of disinfection. These courses are intended more particularly for sanitary inspectors and for men employed at disinfection centres. They will be on May 18 and June 7 respectively. Full particulars can be obtained from the Secretary Royal Sanitary Institute 90 Buckingham Palace Road S.W.1.

Reports of Societies

ORAL INFECTIONS

At a meeting of the Section of Odontology of the Royal Society of Medicine on March 19 Mr WARWICK JAMES presiding Dr E. WILFRED FISH discussed the clinical significance of oral infection the situation and spread of the infecting organisms and of their toxic products in pyorrhoea ulcerative stomatitis and caries in relation to the effect of these diseases on the general health. Owing to the wide nature of the subject and the fact that at the same meeting three cases of osteomyelitis of the jaw were brought forward he confined himself mainly to osteomyelitis.

Dr Fish said that his purpose was to review in the light of recent findings the immediate effect of the organisms which inhabited the paradental sulcus. Pyorrhoea as the name suggested was a chronic suppurative inflammation of the marginal tissues of the gum and in an established case was characterized by a paradental surface ulcerated and lined with granulation tissue on which a degenerated epithelium grew or wilted as a scanty remnant. He drew attention to the tendency of the horny epithelium to split at the point where it was joined by Nasmith's membrane the cleft of the unmineralized nail of the monkey showed exactly the same splitting with the invagination of keratin between the point where the horny layer of the skin joined the horny layer of the nail. Sometimes two teeth seemed to share the Nasmith membrane between them but the interdental space between the two was entirely filled with tissue which precluded both pyorrhoea and caries from developing in that area. There was always however some indication of the constant trauma to which the gum margin was subjected. If the pocket was shallow abrasion often amounting to actual ulceration was produced at the edge of the gum on the spot where the masticatory stress fell. As time went on the surface of dead cementum inside the pocket became covered with fibrin and bled in a serous exudate in which organisms lived and multiplied so that there was a continuous toxic irritation of the ulcerated surface inside the pocket which prevented healing. The organisms were prevented from actually growing into the tissue by the leucocytes but there was a necrotic refractory mass of which the tissues could not rid themselves and this mass formed a refuge for germ. Dr Fish compared the pathology of pyorrhoea with that of bone necrosis and sequestration. In each case an infected sequestrum was surrounded by a non-infected area of bone absorption which was caused by toxic diffusion.

Bone Absorption and Fibrous Tissue Organization

Perhaps the best way to appreciate the condition of the bone was to consider the sequence of events when the bone itself was actually infected by the organism. The sequestrum infected with organisms formed the centre of an area of widespread bone absorption. When a tooth was extracted organisms might be propelled into the vessels of the bone forming the socket. The trauma of extraction broke the bone and in so doing excluded the vessels and imprisoned the organisms. The organisms made the best of this piece of good fortune and they were no longer in danger of attack from the leucocytes and they increased enormously eating every fibre of tissue and from this focus they spread in all directions. The leucocytes hurried to the spot the polymorphs never being able to gain their first and foremost objective a cell actively as possible. The leucocytes at first delayed the spreading of the organism which was imprisoned for the moment but the stream of new tissue from the sequestrum according to the

books there were two ways in which bone could be absorbed, one by the action of osteoclasts and the other by what was called vascular absorption, but there did not appear to be any evidence of this latter, and, the theory was perhaps devised because it was not often that osteoclasts were seen at work.

Bone in a chronically irritated condition could show a large number of Howship's lacunae. If the irritation became too severe the osteoclasts broke up and were replaced by round cells. Observations on chronic inflammatory reactions in connective tissue suggested the following course of events during the invasion streptococci attempting to enter the tissues were met by a wall of polymorphonuclear leucocytes, while the toxic matter diffusing into the surrounding tissues was countered by a round-celled infiltration. When repair set in wandering cells ate the soft tissue debris and the fibroblasts were stimulated to produce scar tissue. In the same way osteoclasts which were formed in response to toxic irritation ate the contaminated bone, while, if the irritant became diluted, osteoblasts were stimulated to lay down new bone and produce sclerosis. The sequence of events in osteomyelitis was therefore fairly clear. The organisms being trapped in the damaged bone in the socket the surrounding matrix became contaminated by the soluble toxic products of those organisms which diffused into it along the lymphatics. The presence of these toxic products which diffused out from the sequestrum into the surrounding bone stimulated the production of osteoclasts at an appropriate distance from the infection and these immediately started to eat away a certain amount of the bone surrounding the sequestrum. It became a question whether the osteoclasts could eat away the bone around the sequestrum before the infection reached the same point. If the osteoclasts succeeded, then they formed a gap between the infected and uninfected bone, which gap would be filled with leucocytes, though the toxic products of the organisms continued to spread. It was important to remember that though the infecting organisms became localized toxic material still diffused from them into the surrounding tissues.

Effect on General Health

The danger to the patient's health was first from the bacteria showered into the blood stream on, for example, extraction of teeth. Normally this transient bacteraemia disappeared very rapidly and did no harm, but there were exceptions. The organisms might become implanted on the heart valve, causing an infective endocarditis. If possible no tooth should be extracted while fibrinous vegetations were still present. The extraction of any dead tooth was still a grave danger even if the pocket had been cauterized. It should only be removed if an acute abscess formed causing severe pain. If a patient with acute non-infective endocarditis had advanced pyorrhoea with sloughing granulations around the gum margin he was in very grave danger even if no surgical interference took place. It was really a choice of evils.

Gingivectomy followed by sound keratinization limited the infection and prevented toxic absorption as effectively as extraction. But gingivectomy, while curing the pyorrhoea, might cause a bacterial shower, in one case out of four that had been found to occur. Another danger from a bacterial shower was that during the few minutes or possibly hours that the organisms were circulating in the blood the individual might bruise a bone and imprison some bacteria in the clot. If this happened there was nothing to prevent them from growing and setting up an osteomyelitis. Apparently the only other possible danger was that these organisms temporarily in the blood stream might find a home in the joints and ends of the bones, thereby producing an arthritis. Theoretically the bacteraemia of pyorrhoea was only a danger in the case of subacute or acute infective endocarditis or in the case of a healthy person who happened

to bruise a bone when the organisms were present in the vessels at the point of such injury. The clinical instance of 'dry socket' was evidence of this, since it occurred only when the bone was badly bruised. The chronic toxic absorption into the tissues was however a much more constant menace. The radiographic demonstration of local tissue destruction was a useful indication that absorption was taking place. Patients varied in their sensitivity to such toxic matter. Certain obvious indications for thorough eradication of doubtful or possible sources of toxic absorption were afforded of which derangement of liver or kidney was perhaps the most certain. In pharyngitis and gastro-intestinal disease the danger of swallowing irritating discharges must not be overlooked. It was very important when called upon to eliminate toxic absorption in the tissues to eradicate it completely, and not merely carry out an isolated dramatic operation.

Dr J WALLACE GRAHAM gave a preliminary report on the toxicity of sterile filtrate from paradontal pockets: the effect of immediate injection into experimental animals of the contents of such pockets having been investigated, and Professor H F HUMPHREYS discussed three contrasting cases of osteomyelitis in the jaw, all of which happened to be under treatment at about the same time. One was a very chronic osteomyelitis in the edentulous upper jaw of a middle aged woman, another a subacute osteomyelitis of the mandible in a boy of 12, and the third an acute osteomyelitis of the mandible following extraction under local anaesthesia of the first lower molar in which intense suppuration spread along the outer surface of the mandible from angle to to angle, followed by death in three weeks from septic pneumonia and cavernous sinus thrombosis.

SPA TREATMENT IN GYNAECOLOGY

The Section of Physical Medicine and the Section of Obstetrics and Gynaecology of the Royal Society of Medicine combined on March 19, with Dr GEOFFREY HOLMES in the chair for a discussion on physical treatment of pelvic disorders in women. Electrotherapy was expressly excluded.

Dr MURIEL KEYES of Harrogate opened with a description of general and local treatment at a spa, and gave a long list of ailments which benefited more or less from spa treatment sometimes in association with other measures. She insisted on the need for care in the selection of cases, especially with a view to excluding early malignancy. It was better to refer many cases back for independent examination by a surgeon or gynaecologist than to overlook one such case and accept it for spa treatment. In spa gynaecology a wide clinical experience kept continually alive by special hospital experience, combined with an honest mind and meticulous care in examination was absolutely necessary. Spa therapy in gynaecology was made much use of on the Continent. British spas were inadequate for this purpose but the fact needed wider announcement.

Dr LEONARD BOYES of Woodhall Spa said that in functional cases the giving of bromo-iodine baths and waters such as Woodhall possessed with dietetic control should prove helpful. Conditions successfully treated had included pelvic cellulitis, subinvolution and sterility due to congestion of the uterus. Spa treatment was useful as a preparation for operative measures. Many a case of fibroids, toxic from constipation and exhausted from haemorrhage, had been made a far better operative risk and given an easier recovery from operation as the result of a course of spa treatment.

Physical Treatments

Professor DANIEL DOUGAL said that physical treatment had been an accepted method in gynaecology right up to

the beginning of the modern surgical era. Since then its popularity had declined. This was not due to bias on the part of those who practised gynaecology but rather to the fact that it failed to produce results in any way comparable to those obtained to-day by surgical methods. That being so, it would be a retrograde step to recommend physical treatment for conditions which they knew could better be treated by surgical operation. There were however many conditions for which surgery was unsuitable or insufficient and in many of these physical treatment gave excellent results and should be employed as a routine whenever possible. The physiotherapist should realize that his position was ancillary and should only treat those cases referred to him by a gynaecologist and that rule should be applied not only to the physiotherapist who specialized in gynaecology but to the gynaecologist who specialized in physiotherapy. Physical treatment might operate by stimulating metabolism or by acting directly on diseased structures, the former method was much more valuable in gynaecology, the latter had a very limited application. He agreed that in every case of disturbed function the general health should be the first consideration and all possible measures be taken to restore it to normal. Although the reproductive function was controlled by the anterior pituitary and ovarian hormones it was still true that the general health was all important. Again gymnastic exercises which strengthened the muscles of the pelvic floor were a useful prophylactic measure in reducing the incidence of prolapse. Uncomplicated backward displacements of the uterus generally produced no symptoms whatever, but when they did he thought it a better and quicker method of treatment to operate on them. In the field of infection physical methods might be most usefully employed. Acute and subacute infections of the lower genital tract could be treated expectantly. On the other hand, pelvic infections required more active treatment. Acute salpingitis was now treated expectantly. As active surgical treatment resulted in a very much higher mortality and also interfered with the complete recovery of the diseased structures which might be expected to occur in a large percentage of these cases. Physical methods were of no value as a curative measure in the treatment of uterine fibroids and might even be harmful in delaying necessary surgical treatment. The surgical treatment of these tumours was so successful that it was a great mistake to depart from present practice and adopt methods which it best were only palliative. As for physical treatment before and after operation no doubt many patients would be better surgical risks if they received a course of spa treatment before operation but it was doubtful whether the slight improvement in the results would compensate for the delay. The average patient who had undergone a major operation returned home at the end of three weeks and was then placed under the care of the family doctor and instructed to take things easily for another month or so. He was sure that in intermediate period if a spa hospital would be beneficial if treatment were so planned that it hastened the patient's convalescence and did not actually prolong it.

Benefits and Dangers of Spa Treatment

Dr J D BARRIS said that obstetricians and gynaecologists did appreciate the value of spa treatment in certain of their cases. They advised many patients suffering from minor pelvic disorders to take a course of treatment at a spa, preferably British. But the object in sending them there was on account of the beneficial effects upon their general health rather than the specific effect upon their local condition. Co-operation between the physiotherapist and the gynaecologist was essential. All patients should first be seen by a gynaecologist in order to establish the diagnosis, to make sure that no serious pelvic lesion had been overlooked and no need for surgical treatment delayed. He considered that the functional side of dysmenorrhoea was quite unexplored. The patient was usually

a young woman who was perfectly well between her periods. It was essential to her recovery that she should be encouraged to lead a normal life that her mind should be taken away from her pelvis and that she should not regard herself as an invalid whereas the atmosphere of a spa would tend to suggest to her that she was. Nor was all dysmenorrhoea functional. It might be due to tumours of the uterus or other causes for which surgical or radio logical treatment gave the best results. Patients undergoing the menopause again were unsuitable for spa treatment for they, too were best helped by being encouraged to live a normal life. In cases of pelvic inflammation, not of an acute nature with no pus present local heat or spa treatment did good. In cases showing pelvic pain and no definite physical signs the type of patient must be chosen carefully for physical methods. Sometimes the pain in these patients was nothing but a psychological barrier raised by them to escape their duties and to send them for spa treatment did not really help them in the long run.

General Discussion

A French visitor Dr MOURGOT gave some account of the virtues of French spa waters, and in particular of a device for facilitating the absorption of natural gases through the skin a method he had used for the treatment of circulatory disorders and which he thought applicable to some gynaecological conditions. Dr CLIFFORD WHITT agreed that spa treatment did seem to stimulate the hormone secretion and alter the menstrual rhythm. But when Dr KEVES spoke about endometritis as suitable for spa treatment he was completely lost because endometritis could not be diagnosed until a section was taken. He would never think of advising surgery for a patient who merely complained of odd pains in the pelvis but with a definitely enlarged tender ovary, he was inclined to suspect some pathological condition which could be demonstrated under the microscope and one not likely to be benefited by general methods.

Dr S K. WESTMANN said that in addition to the use of spas and waters there was another more recently applied form of physiotherapy—namely physical exercises with or without spa treatment—which was worthy of consideration. This helped to conserve the elasticity of the muscles of the pelvic floor. But before any physical treatment was recommended a most careful gynaecological examination must be carried out for both spa treatment and physical exercises were strong stimulants which might rightly be compared with a dangerous drug. Sir COMYN BELLER said that on hearing the long list of diseased conditions which the opener had said could be alleviated by spa treatment he rather felt that he must have done great numbers of operations unnecessarily.

Dr GEOFFREY HOLMES said that as a spa practitioner he was interested in what was evidently a general impression amongst gynaecologists as to the danger of the spa complex. But the whole of the psychological atmosphere of a spa was designed to counteract the adverse influences and dangers mentioned. As to the possibility of serious pelvic disease being overlooked he could assure them that many people went to spas without seeing a gynaecologist and it was at the spa that it was discovered that they had serious pelvic disorders. He saw many women with commencing arthritis in the decade of the menopause and he was personally satisfied that there was a clinical entity which might be described as menopausal arthritis and that of all the forms of arthritis at spas none responded better to spa treatment. Dr MURIEL KEVES in replying to the discussion, said that it was quite a wrong impression that people at spas were taught how to be ill. On the contrary they got a little holiday and were taught how to live and how to rest. It had been said that the young dysmenorrhoeic patient should not be sent to a spa. If she was toxic and constipated and spa treatment did her good perhaps best of all it got her away from her mother.

PATHOLOGY OF CRIMINAL ABORTION

At a meeting of the Liverpool Medical Institution on March 11, with Mr R KENNON in the chair Dr W H GRACE read a paper on the pathological aspects of criminal abortion

After briefly reviewing the historical references to the subject, Dr Grace quoted the sections of the Offences Against the Person Act which were involved and noted that only the word miscarriage was used meaning the emptying of the uterus at any stage of the pregnancy that there was no attempt to define the word unlawfully or to define lawful emptying of the uterus and that there was no difference in the nature of the crime if the uterus did not contain the products of conception. Death due to criminal abortion was usually one of two types (1) a quick death—usually occurring within half an hour of the abortion and caused often by shock, and more rarely by air embolism, and (2) a lingering process varying from a matter of days to weeks or more in which death was due to sepsis

Methods of Procuring Abortion

The methods of procuring criminal abortion were next considered under the following headings (1) violence applied generally—including rolling downstairs kneading or compressing the abdomen, etc., (2) internal administration of drugs—here the speaker made the following observation: There is no drug and no combination of drugs which, when taken by the mouth will cause a healthy uterus to empty itself unless it be given in doses sufficiently large to endanger seriously, by poisoning, the life of the woman who takes it, (3) mechanical injuries to the uterus and its contents—this section was subdivided into (a) direct violence, including the use of uterine sounds, catheters, wire, pieces of wood, umbrella ribs, hairpins, penholders, etc., and (b) injection of fluids—soap solutions and sodium bicarbonate, for example. Dr Grace described his method of examination in cases of suspected criminal abortion, emphasizing the importance of keeping all objects and organs which might be used as evidence, and concluded his paper by referring to the subject of dying declarations and the method of ensuring their legality

General Discussion

In the discussion which followed, Dr E CRONIN LOWE mentioned the difficulty often met with in those cases in which death had ensued from self attempted abortion. Often there was no evidence of damage to uterus cervix or vagina and death had apparently resulted from shock associated with the psychological disturbances of apprehension and fear. The need to follow Dr Grace's advice as to collecting any fluid in the vagina was important, as this might in certain cases give the only evidence available of attempted interference. He asked Dr Grace if he had observed the tendency to septic infection to occur more often in the right broad ligament in those cases of death from sepsis, even although little or no evidence of damage to the uterus itself was found. He quoted two recent cases in which these findings were present and although in neither of them could criminal interference be proved yet in both suspicion was very strong and he suggested that it was a point worth remembering that right sided pelvic infection in such cases suggested interference by some mechanical means and probably carried out by someone other than the deceased

Dr W A MACRAY, referring to the possible association of right sided lesions with interference said that this had been suggested by the occurrence of two somewhat similar cases where there had been a lesion in the right broad ligament and where attempted abortion had been suspected. In the first, the occurrence of a rigor soon after bimanual examination led to surgical exploration. Removal of a great part of the thrombosed broad ligament and drainage was followed by recovery. In

the second case the patient was too ill for operation when she came under observation. There was a very obvious affection of the right side. Although after death and after hardening of the parts no evidence of interference could be found some time later rumour which was probably well informed insisted that abortion had been procured. With regard to reporting cases to the police, doctors were in no sense criminal detectives and usually nothing should be done. In case of death communication with the police became a duty

Mr M DATNOW agreed that the causes of miscarriage should come under three main headings. General violence, Mr Datnow thought should include shock and fright as he had come across a number of such cases although quite often severe physical injury did not result in any disturbance of the pregnancy. In connexion with drugs Mr Datnow referred to certain animal experiments which he had carried out, using many of the well known abortifacients but he had never succeeded in bringing about abortion with them—in fact some actually tended to prolong the period of pregnancy, lead, on the other hand almost invariably produced abortion. He did not agree that local injury by the injection of fluids would bring about abortion unless the fluid was injected into the uterine cavity. He drew attention to certain soap pastes which were being extensively used on the Continent to bring about abortion therapeutically. In conclusion the speaker concurred with Dr Grace's views on the importance of keeping all material that was removed from cases of criminal abortion so that it would be available for inspection and examination by all concerned

Mr C H WALSH stated that in his opinion criminal abortion was on the increase. A favourite method was by intra-uterine injections, which left little or no trace of trauma, and rarely any incriminating material, making it difficult to detect the evildoer. He agreed with Dr Grace that there was no known drug taken by mouth which would procure abortion without disabling or killing the mother, and instanced a recent fatality which had occurred in a patient admitted to hospital moribund as the result of taking an overdose of female pills so consistently and largely advertised in the daily press

Pathological Specimens

At the same meeting a series of pathological specimens taken at operation or necropsy were shown. Dr W E COOKE and Dr G RONALD ELLIS demonstrated post-mortem specimens from two cases of congenital microcolon. Dr Ellis at the same time described a case of multiple cerebral abscesses secondary to bronchiectasis. Professor R E KELLY, Mr A S KERR and Mr R KENNON showed two post anal dermoids which had been removed at operation, and Mr Kerr and Mr Kennon described also a suprasternal dermoid and a case of tuberculous kidney with giant ureter. After some discussion on this last case Dr T F HEWER and Dr A DOUGLAS BIGLAND gave an account of a case of subarachnoid haemorrhage from an aneurysm of the circle of Willis

The sixth general meeting of the Midland Mental Pathological Society was held at the Anatomy Theatre of Birmingham University on March 18 with the president Sir GILBERT BARLING in the chair. Sir ARTHUR J HALL gave a lecture on Some Features of Chronic Epidemic Encephalitis (Lethargica). This was illustrated by many lantern slides and a cinematograph demonstration of the characteristic poise and gait the kiresia paradoxa and the lid movements associated with efforts to overcome oculogyric crises. Dr STANLEY BARNES in proposing a vote of thanks remarked on his association with the lecturer and his special study of the disease. Dr B H SHAW seconded the vote which was carried with enthusiasm. Dr J H MALLOY contributed to the discussion, and Sir ARTHUR HALL replied

Local News

ENGLAND AND WALES

Merseyside Hospitals Council

At the annual general meeting of the Merseyside Hospitals Council held at the Liverpool Town Hall on March 24, Mr W Sutcliffe Rhodes chairman of the David Lewis Northern Hospital since 1934 was elected to succeed Lord Cozens Hardy as chairman of the Council. In 1935 Mr Sutcliffe Rhodes was invited by Lord Derby and Sir Benjamin Johnson to join the newly formed Associated Voluntary Hospitals Board and he has been nominated a member of the committee of the proposed Royal Liverpool United Hospital whose Bill is now before Parliament. He has taken an active interest in the voluntary hospitals for many years and was first elected to the committee of the David Lewis Northern Hospital 13 years ago and has represented that institution on the Merseyside Hospitals Council since 1934. In 1936 he was invited to become chairman of the Medical Charities Committee of the Liverpool Council of Social Service.

Hospital Libraries

A meeting to further the hospital library movement was held under the auspices of the British Red Cross and Order of St John at County Hall London on March 17. The values attaching to a hospital library might be supposed to be the same whatever the character of the hospital but there are differences as were shown by speakers representing successively the voluntary hospitals, the general municipal hospitals and the mental hospitals. Sir Alfred Webb Johnson after referring to the value of books as an aid to recovery during the period following operation mentioned that the Middlesex Hospital was fortunate in having a well-equipped patients' library and a good nurses' library in addition. But without an efficient librarian such as they had at the Middlesex, half the value of book collections for patients was lost. His view was that the book depot should be entirely in the librarian's charge and that patients who remained in hospital a long time should have the facility for obtaining books on request for which purpose the hospital would need the backing of a public library. It was important to provide light and illustrated periodical literature for patients in capable of continuous mental effort. Dr Letitia Fairfield who spoke from the point of view of the London County Council hospitals said that these hospitals contained a large proportion of chronic patients. Such patients often tended to exhaust the sympathy and patience of their friends and their need for sustaining literature was more serious than that of the acute patients. It might be thought that people confined for long periods to bed could undertake definite courses of study but actually their disability was apt to cause mental stagnation. One of the aims of the hospital librarian therefore must be to rouse such patients to a belief in their own capacity to inspire them with the delights of literature and to bring into the sick room the past as well as the present. Reading had not only a mental but a physical effect and a ward was a better and happier place if the patients had something to think about besides their own unfortunate condition. Sir Laurence Brock chairman of the Board of Control spoke of the special position of patients in mental hospitals. It was no always realized how many patients in such hospitals were capable of reading and enjoying books. Reading was not merely a harmless sedative but often had definite therapeutic value in that it helped patients to get rid of imaginary troubles. He reminded the audience that the tastes of mental patients were not altered as a result of their mental instability and the librarian to example still had to select on a therapeutic basis. The Red Cross effort to

encourage hospital libraries was the more necessary because of the limit set to the efforts of local authorities. It would of course never be possible to allow outside voluntary workers the same liberty of access to mental as to other types of hospitals but there were many ways in which the advice and assistance of the British Red Cross and Order of St John Library could be of value in this special field. The meeting was also addressed by two librarians the borough librarian of Watford Mr George Bolton, and the head librarian of the Lewisham Hospital Miss Kellaway. It was mentioned that the hospital library movement was a "war baby"—one of the very few beneficial outcomes of the great war.

Attack on Maternal Mortality in Birmingham

As one line of attack on maternal mortality in Birmingham a 'flying squad' service has been established with the object of bringing the best medical and nursing aid to the bedside of the patient in cases of severe obstetrical shock, haemorrhage etc. This flying squad operates from the Birmingham Maternity Hospital and consists of a complete emergency outfit equipped to deal with every obstetrical emergency and under the charge of a staff nurse who is a trained midwife of the hospital. The scheme is worked in connexion with the Birmingham Health Centre and the St John Ambulance Brigade and arrangements have been made with the latter for an ambulance to be available within a few minutes of receiving a call to take the equipment and the nurse to the patient's home, the surgeon going independently. At the annual meeting of the governors of the Birmingham and Midland Hospitals for Women it was stated that the 'flying squad' had been called out five times so far and in three of these it had been the means of saving a woman's life. This is a highly commendable scheme and it is to be hoped that hospital authorities in other areas will not be slow in following the example of Birmingham.

SCOTLAND

Vacation Courses for Students

Professor T K Monro formerly of the chair of practice of medicine at Glasgow University addressing the students at St Mungo's College Glasgow at the prize giving ceremony on March 18 said that great progress had been made of recent years in the prevention, diagnosis and treatment of disease by public health authorities and laboratory workers. The general practitioner however was the first line of defence against disease and it was essential that his training should be as thorough as possible. He believed that before long medical students would be required to devote part of the long summer vacation to hospital work. There was a general feeling even among students that the July to October holiday was unnecessarily long and that instruction which was clinical and practical might be instituted during this period. Professor Monro thought that the great reputation of Scotland as a training ground for good general practitioners was due to the high quality of the teaching which had been available in its medical schools for a long time.

Elsie Inglis Memorial Maternity Hospital

At the annual meeting of the Elsie Inglis Memorial Maternity Hospital Edinburgh on March 18 Lady Ruth Balfour M.B. presiding stated that the death rate in the hospital during the past year had been only 4 per 1000. In moving the adoption of the annual report of the combined women's hospitals she said that in the Bristlefield Hospital 555 in patients and 2000 out-patients had been treated during 1936 while at the Elsie Inglis Hospital 1255 in patients and 2000 out-patients had been treated. It was proposed to open a new out-patient department at the Bristlefield Hospital and a new out-patient department at the Elsie Inglis Hospital.

accounts of income and expenditure showed a deficit of £3 204 but legacies amounting to £6,575 have been received

Edinburgh Dental Hospital

At the forty-fifth annual general meeting of the Incorporated Edinburgh Dental Hospital and School Professor Sydney Smith who took the chair, announced that the governors proposed to extend the hospital buildings at a cost of about £35 000. Towards this sum the Dental Board of the United Kingdom had promised a donation of £5 000. At the present time this was the largest dental school in Scotland and the second largest in Great Britain, with 250 students in 1936. The premises had therefore become inadequate and the equipment was not sufficiently up to date, so that a large addition to the accommodation equipment, and staff must soon be made. The annual report shows a great advance in the work done by the hospital during 1936. The total number of conservation cases was 19,395 compared with 13,313 in 1935. In the prosthetic department the number of dentures, repairs etc. was 1,978 compared with 1 766 and the number of extractions increased from 17 708 to 22,742. The number of new patients during 1936 was 9 921 compared with 8,299, and the total attendances 29,369 against 22 194. With regard to finance the report shows a surplus of £684 but although this is regarded as satisfactory all the money available will be needed for extension and equipment of the buildings, and it is proposed shortly to issue an appeal to the public for funds.

IRELAND

Crown Nominee on GMC

The *London Gazette* of March 19 announces that the King with the advice of his Privy Council under the provisions contained in the Medical Acts has renominated Colonel Thomas Sinclair CB FRCS MP, to be, for a period of five years from May 13, 1937 a member of the General Council of Medical Education and Registration of the United Kingdom, for Ireland. Colonel Sinclair has served on the Council since 1927 when he was nominated to succeed Sir Edward Coey Bigger.

The Belfast Meeting Accommodation

Dr F P Montgomery chairman of the Housing and Lodgings Committee for the 105th Annual Meeting of the British Medical Association at Belfast next July informs us that hotel accommodation in particular and other accommodation in general is being rapidly booked up for the period of the meeting. All officers of Sections and all speakers who have undertaken to take part in the Sectional proceedings should arrange accommodation as soon as possible if they have not already done so. Requests for hotel accommodation should be sent direct to Thos Cook and Son Ltd 27 Royal Avenue Belfast and requests for all other types of accommodation should be sent to the office of the Annual Meeting Whitla Medical Institute, College Square North Belfast.

Royal Maternity Hospital, Belfast

The registrar's report of the Royal Maternity Hospital, Grosvenor Road Belfast covers the period from January, 1932 to December 1935. It deals with the work of the Belfast Maternity Hospital until July 31, 1933 and after that date of the Royal Maternity Hospital which was opened on August 1 1933. The latter hospital contains a unit for the treatment of all forms of potential and established sepsis. To this unit are admitted many emergency or unbooked cases often frankly septic on admission. For the year 1935 the maternal mortality rate was 1.6 per cent for all admissions 0.6 per cent for ante natal admissions and 4.4 per cent for emergencies. Owing to a rise in the rate for the last-named category these figures are slightly less satisfactory than those of the

preceding years. Concise summaries are given of the seventy-five cases involving maternal death which occurred during the whole period under review. The series includes four cases of acute yellow atrophy of the liver. The statistics for maternal morbidity show a gradual improvement. The rate for 1935 was 4.9 per cent. Analysis shows a high incidence of infection of the urinary tract with thirty-nine cases comparing with forty one cases of puerperal sepsis during the whole period. The total number of patients admitted in 1935 was 1 413. Triplets were born on two occasions in the course of that year, and two cases of triplets are also recorded for 1932.

Correspondence

Combined Universities Election

SIR—May I, through your columns thank all those who gave me their support at the recent election and especially those who at headquarters or in certain Divisions (particularly in Birmingham) put themselves to considerable trouble by taking very active steps in this direction?

I should like it to be known that I undertook this candidature, against my own inclination, in pursuance of the definite resolutions of the Representative Body of the British Medical Association. (1) That with a view to ensuring the presentation to Parliament of expert medical opinion on matters relating to the health of the community or involving the welfare of the medical profession the Representative Body approve the principle of securing the services of a Member of Parliament intimately acquainted with the aims and policy of the British Medical Association. (2) That steps be taken forthwith to make preliminary inquiries for the selection of a medical practitioner intimately acquainted with the aims and policy of the Association with a view to his election to Parliament through one of the University seats. The Committee of the Association charged with the duty of implementing these resolutions urged me when the parliamentary vacancy occurred, to become a candidate and I did not feel at liberty to refuse.

The expectation of success in such a candidature even in what appeared to be favourable circumstances was perhaps never very high but the actual figures of the result were disappointing. What conclusions the Council may draw from them or what action may follow upon such conclusions, I do not of course, know. The result however, appears to indicate that even in a University constituency and with a candidature genuinely independent of all party considerations common action among doctors as such or teachers as such, or between the two professions, is not to be expected. Divided loyalties combined with a considerable measure of complete indifference, produces curious outcomes which can be tested only by experiment—I am, etc.

London NW 11 March 24 HENRY B BRACKENBURY

SIR—Those who made some effort to promote the success of Sir Henry Brackenbury's candidature in the recent election contest must feel greatly disappointed at the result. The election followed on usual party lines and the reasoned argument in Sir Henry's election address on complete independence seemed to carry little weight with that portion of the constituency which included medical graduates. When the very small number of medical men now in Parliament is considered surely it must have occurred to the medical portion of the constituency that the addition of a member of his calibre experience and past record of work for the profession

would have been alike an asset to the profession and to the House of Commons itself. The past and passing generation of medical men are generally aware of this but it is likely that the younger generation are completely ignorant of the efforts which have brought them a heritage of a better professional life than that extant thirty years ago and it is probably the younger generation which has swayed this election.

It is not only on questions of intrinsic interest to the profession—national health insurance hospitals organization of public health services—that medical influence should be exercised in Parliament but the great problem of number and quality of the population now looming in the near distance involving such human biological problems as sterilization of the unfit, birth control reform of the abortion laws and maternal mortality will need adequate medical representation if legislation is to be effective and just. Again there have been repeated attempts to foist an absurd system of medicine into official recognition and it was chiefly due to Sir Henry's evidence before the committee of inquiry that the last attempt failed completely. It is said that public memories are notoriously short but surely this shallow pated amnesia should not afflict the medical profession—I am, etc.,

Warrington March 28

J. S. MANSON

The Value of Liver Extracts

SIR—We wish to draw attention to the report of the meeting of the Section of Therapeutics and Pharmacology of the Royal Society of Medicine in your issue of March 20 (p. 629). Dr Janet Vaughan is reported as having made the following remarkable statement—namely that if she suffered from pernicious anaemia nothing would induce her to be treated with anhaemin. Ungley Davidson and Waine (*Lancet* 1936 1 349) published full details of a most carefully controlled series of thirty-six cases of pernicious anaemia treated with anhaemin which clearly demonstrated that anhaemin is one of the most potent preparations of the anti-anemic principle available anywhere in the world. Since the publication of this paper we have treated many more cases of pernicious anaemia with anhaemin with the same results. We find that an initial injection of 4 c.cm. will produce a maximal reticulocyte response, a satisfactory red cell increase and a rapid improvement in the clinical condition. Thereafter 2 c.cm. given at ten-day intervals soon brings the blood count up to normal. So satisfied are we with the activity of anhaemin that when assessing the potency of new experimental liver fractions we use this substance for choice for control purposes. For maintenance treatment we have kept twenty cases of pernicious anaemia for a period of one year at a normal blood level by the injection of 5 c.cm. of anhaemin at two-monthly intervals.

It is for these reasons that we are at a loss to understand the statement attributed to Dr Vaughan quoted above. The fact that Dr Lucy Wills obtained responses in monkeys with crude preparations of liver extract and not with anhaemin is of scientific interest but since the monkeys were suffering from an anaemia produced by dietary deficiencies and were certainly not suffering from Addisonian pernicious anaemia her results do not indicate in any way whether or not anhaemin is of value in the disease occurring in human beings. Lastly we are at a loss to understand Dr Vaughan's calculation that it would have cost her £7 to cure her first patient with anhaemin. We are, etc.,

STANLEY DAVIDSON
HAROLD W. TULLYTON

SIR—In your issue of March 20 you publish an abbreviated report of some remarks I made at a meeting of the Section of Therapeutics and Pharmacology at the Royal Society of Medicine. I feel that as they stand the statements are open to misinterpretation and I should like to amplify them and to correct one misstatement of mine. I emphasized that my experience of treating patients with Addisonian pernicious anaemia in relapse with anhaemin had been limited and that my objections to the pure preparations were theoretical. The work of Subbarow, Jacobson and Prochownik (*J. Amer. chem. Soc.* 1936 58, 2234) shows that there are at least three chemical substances which can be isolated from crude liver extract and which have varying haemopoietic activity but appear to be complementary to one another in their effect on Addisonian pernicious anaemia. These observations together with those described by Dr Lucy Wills suggest that possibly the purer fractions like anhaemin do not contain all the haemopoietic factors. Until more is known of the relationship of these factors I feel I would prefer for myself to play for safety and use a crude extract which contains them all rather than a pure preparation which possibly may lack one or other of them in adequate concentration. I admitted, however, that this was a purely theoretical objection.

The practical experience of Professor Davidson and Dr Ungley all emphasize the value of anhaemin. I stated that all the pedigree cases of pernicious anaemia I have had the opportunity to treat have maintained a completely satisfactory count on 1 c.cm. of anhaemin once a month. This statement was not reported. Owing to the complex chemical procedures involved in their preparation the purified extracts are necessarily more expensive than the less pure and in patients of the hospital class even the difference of a few pence must often be considered. A monthly maintenance dose of 4 c.cm. of less pure preparations costs less than 1 c.cm. of anhaemin. My calculation of the cost of £7 to produce a normal blood count was based on what I am now told is an out of date price. I apologize for my error. The patient required 28 c.cm. to raise her red cell count from 1,700,000 per c.mm. to 4,700,000 per c.mm. which at the present quoted retail price would mean £4.4s. Of course patients vary considerably in the amount of extract required and therefore in the cost of treatment.

It is only however by the further preparation and clinical trial of such pure preparations that we can hope to solve the problem of the nature of the haemopoietic fractions in liver and as a step to the solution of this problem the importance of anhaemin cannot be over-emphasized—I am, etc.,

London W.12 March 23

JANET VAUGHAN

SIR—In your report of the meeting of the Section of Therapeutics and Pharmacology (*Journal* March 20 p. 629) Dr Janet Vaughan is quoted as saying that personally if she suffered from pernicious anaemia nothing would induce her to be treated with anhaemin. She spoke of the danger of treating patients with these highly clarified fractions apparently on the assumption that the purer extracts did not contain all the haemopoietic factors. That monkeys rendered anaemic by dietary deficiency respond to a haemopoietic factor present in camponon but absent from Dalin and West's fraction is not a sufficient reason for treating Addisonian pernicious anaemia with crude extracts unless it can be shown that the latter will produce in human subjects beneficial effects differing from or greater than those which are obtained with a purified product. No satisfactory laboratory test for activity is available and to assess the value of a

product for use in pernicious anaemia one must observe its effect under controlled conditions in a series of cases of the disease as it occurs in man

The original Dakin and West's fraction was tested in this way in thirty six cases of pernicious anaemia,¹ and a more purified product in twenty cases.² These and subsequent experiences have demonstrated the consistently high efficacy of this fraction for restoring and maintaining a normal blood status. The clinical effects are not less striking than those which follow the use of crude extracts, and there is in fact no evidence that Dakin and West's fraction lacks any element necessary for inducing complete remission of all those manifestations of pernicious anaemia which are susceptible to the influence of liver treatment.—J am, etc,

C C UNGLEY

Gas-and-air Analgesia

SIR,—An article entitled 'Gas-and-air Analgesia in Labour,' appearing in your issue of March 20, contains the statement that 'gas-and-air analgesia was first tried in October, 1933, by Dr Minnitt of Liverpool, who adapted for his use an American nitrous oxide apparatus. May I point out that the latter half of this sentence is incorrect. If reference is made to the *Lancet* of June 16, 1934 (p 1278, and to the *Proceedings of the Royal Society of Medicine* August, 1934, vol 27, Section of Anaesthetics, pages 33 to 38) it is there recorded that the apparatus devised for the purpose of giving gas and air was an adaptation of a McKesson oxygen therapy apparatus.—I am, etc,

R J MINNITT

Terminal Caseating Tuberculous Bronchopneumonia

SIR,—I was very interested and gratified to read the article by Dr C E H Turner in the *Journal* of March 20 (p 604) on the secondary infection of the lungs from caseating bronchial glands. Hilus tuberculosis is comparatively easy to diagnose by clinical signs in the adult. It is by no means uncommon in children, and though clinical signs are not nearly so definite when combined with a persistent irritating cough it is usually possible to make at least a provisional diagnosis. Clinical research, extending over a period of many years, forced me to the conclusion that secondary, or endogenous, infection from the bronchial glands was a common cause of pulmonary tuberculosis in the adult, and the results of my observations were published in the *British Medical Journal* in 1929 (August 24, p 335). Experience has strengthened this view, and Dr Turner's case is a further confirmation. Three cases which were under my observation as probably hilus tuberculosis suddenly in a matter of hours, showed clear clinical evidence of extensive involvement of a lung obviously of a tuberculous pneumonic type. In one case not only were tubercle bacilli found in the sputum but the radiograph showed clear evidence of spread from the root glands. It frequently happens that a latent tuberculous gland is suddenly reinfected from a bronchial catarrh, such as accompanies measles or influenza, which leads to a lowering of the focal and general resistance. Such glands are almost certainly adherent to the adjacent bronchus, and if the infection is acute the chances of a break through are far from negligible, the final result depending on the number and virulence of the tubercle bacilli present. The difficulty of finding tubercle bacilli in

caseous material is well known, so that complete apparent recovery is not impossible. One such case was recently examined by x rays after an interval of seven years, and the lungs were reported normal, yet this same case shows periodic evidence of tuberculous toxæmia and physical signs in the lungs of a suggestive character whenever she catches cold, as she frequently does. I do not consider the prognosis good, and would hesitate to certify her as a normal insurance risk.

As often happens all three cases were under observation at the same time including one diagnosed as acute tuberculous infection of the bronchial glands which did not break down and led to pulmonary invasion. He has remained perfectly fit and free of any suspicion of pulmonary tuberculosis after a period of about ten years. Other cases have been observed, but none was quite so definite or dramatic in the sudden onset, yet there is every reason to believe that others arose in the same way, although more slowly and insidiously.—I am, etc

Birkenhead, March 22

D I GARR JOUNSTON

Radiograph or Skiagram

SIR,—With reference to Mr Lawson's letter (*Journal* March 20, p 641) I hasten to disclaim responsibility for any launching of a crusade for a more elegant term. My previous letter (*Journal* March 6, p 530) was essentially a protest against the suggested employment of the word 'radiogram,' on the reasoning that in the absence of a freshly coined and more acceptable one it is unwise to desert the word radiograph, which is in more general use among radiologists in this country.

In the correspondence to which I referred the words radiograph, skiagraph, roentgenograph, and their corresponding -grams were all discussed, and as etymological probing into their lineage appeared to have brought little credit to any of them my arguments were restricted to the question of usage, with special reference to the fact that radiogram has several generally accepted meanings.

Mr Lawson's letter suggests that there would be no such potential confusion if the word skiagram were adopted, but reference to the nearest dictionary produces the following information:

SKIAGRAPHY (or SKIA-) Art of shading in drawing etc. photography by roentgen rays. vertical section showing interior of house etc. finding of time by shadow as in sundial. So SKIAGRAPH etc.

As skiagram in its application to an x ray photograph entered the lists in the same few weeks of 1896 as did radiograph and radiogram—and skiagraph also—it had an equal chance of survival, but I venture to submit that it has no case.—I am, etc

Worthing March 20

R BOULTON MILES

The Medical Illustrator

SIR,—May I, as an artist who is now attached to a medical school after spending five years at an art school and the greater part of three years at a medical school with the intention of becoming a medical illustrator, be allowed to write a few words.

I was deeply interested to find in your issue of February 13 an article on medical illustration from a fellow artist who has a true understanding of the ideals of what medical illustration should be and what the carrying out of these ideals involves. It certainly means long and arduous training—hence the personal details at the beginning of this letter—but this has yet to be appreciated by the majority of the British medical profession. The lack of under-

¹ Ungley C C Davidson L S P and Wayne E J *Lancet* 1936 1 349
² Ungley C C *Lancet* 1936 2 1513

standing that medical illustration is a 'specialists' job which cannot be executed by people who merely 'draw and paint a little, is responsible for the low standard prevalent in this country. We are far behind America and Germany in this respect.

The medical profession ought to realize that this specialized ancillary service must be given proper surroundings much of the free lance work is poor indeed many good artists who undertake it are eventually forced into commercial draughtsmanship because they cannot sacrifice themselves to the cheap production demanded of them.

The ideal solution to this problem is for each medical school hospital or clinic to employ an artist on the staff and the artist should be prepared to be vitally interested in all stages of the research work and (because of the previous training) should guide all the illustrative work of the department which should include photography. I emphasize photography because these two branches are closely united. Good photography as an illustrative agent cannot be ignored it is for the artist to combine the two and decide whether a specimen should be drawn or photographed. I know many artists will disagree with me but I have found this essential and I think medical illustrators should hold a broad minded view when remembering the purpose of their work in medical research. Therefore the artist should be familiar with all branches of scientific photography thus knowing the capacities and limitations of both sides—I am etc.

Medical Aid in Southern Spain

SIR—Since the fall of Malaga the plight of the wounded and the refugees in Southern Spain is very serious. My husband has taken a British University Ambulance Unit to Almeria and has succeeded in establishing a hospital, two front casualty clearing stations, a food station and a children's hospital outside the town on the road to Lorca. He hopes to establish several more at intervals of twenty miles to the point where the railway begins to run again. The unit at present consists of Sir George Young, Miss Thurstan (the commandant), two nurses, three drivers, two cars and an ambulance.

A woman doctor and two more nurses went out last week. There has been a wide response to appeals for supplies for the unit but its work is severely hampered for lack of surgeons and staff. If any fully qualified doctors or surgeons were willing and able to go out it is certain that many more lives could be saved. Expenses out and back will be paid and kept out there. If such there are I should be most grateful if they would get in touch with me in the first place stating for how long they would be able to stay out—I am etc.,

March 29

J. HELEN YOUNG

The Old English Inn

SIR—I notice that Lord Horder in his address to the British Health Resorts Association at Bournemouth (*Journal* March 20 p. 626) asked: "Where was the old English inn, the inn of Dickens and Fielding and Smollett and Charles Lamb? If we may judge by Dr. Tobias Smollett's description of his journey to the south of France in 1767 it is probable a good thing that the old inn in England and in France have disappeared and given place to the clean and comfortable hotels that we all know. Writing from Bournemouth, Smollett himself ex-

Though I was well acquainted with the road to Dover and made allowances accordingly I could not help being chagrined at the bad accommodation and invidious imposition to which I was exposed. I need not tell you that this is the worst road in England with respect to the conveniences of travelling and must certainly impress foreigners with an unfavourable opinion of the nation in general. The chambers are in general cold and comfortless, the beds paltry, the cookery execrable, the wine poison, the attendance bad, the publicans insolent and the bills extortion. There is not a drop of tolerable malt liquor to be had from London to Dover. Dover is commonly termed a den of thieves and I am afraid it is not altogether without reason that it has acquired this appellation. The people are said to live by piracy in time of war and by smuggling and fleeing strangers in time of peace but I will do them the justice to say they make no distinction between foreigners and natives.

Poor Smollett, his complaints of conditions in the French inns are even more severe but he hints that he was sometimes "more than usually peevish from the bad weather as well as from the dread of a fit of asthma with which I was threatened. One cannot accompany him on his journey from Boulogne to Nice by way of Paris, Fontainebleau, Dijon, Lyons and Montpellier without sympathy in all his discomforts and grumbles.

The whole volume of his *Travels* made up as it is of letters to friends is full of interest and entertainment—I am etc.

Cannes March 20

A. A. WARDEN

Obituary

ALEXANDER CORSAR STURROCK, M.D.

Consulting Physician, Salford Royal Hospital

Dr. Alexander Corsar Sturrock died at his home in Eccles near Manchester on March 27 at the age of 65. He was born at Linlithgow and studied at Edinburgh University taking the Master of Arts degree in 1892. Afterwards he went on to the medical school and took the M.B., Ch.B. with first class honours some four years later. In 1898 he gained the M.D. with a gold medal. For a short time he acted as an assistant in the physiological department at Edinburgh before being appointed house-surgeon to the Grimsby Hospital. In 1900 he was appointed resident medical officer to the Manchester Royal Infirmary for a period of two years after which he began a busy and successful life in Eccles as a general practitioner. In 1906 he took the M.R.C.P. (Lond). He served for two years in the Royal Army Medical Corps in Salonica and in France and was mentioned in dispatches. Returning home after the war with the rank of major he took up consultant work in Manchester being appointed to the honorary medical staff of the Salford Royal Hospital. He was at the same time an honorary physician to the Eccles and Patricroft hospitals. Dr. Corsar Sturrock was a member of the Manchester Medical and Pathological Societies and was honorary secretary of the Lancashire and Cheshire Branch of the British Medical Association for the years 1923-7. About this time he developed a special interest in nervous and mental diseases and took charge of an out-patient department at the Salford Royal Hospital which was organized in association with the County Mental Hospital at Prestwich and it was at that time a new departure in general hospital practice. In collaboration with Dr. Orr he wrote a paper on the "Influence of the Sympathetic on Infection of the Central Nervous System."

Dr. Corsar Sturrock's opinion was often sought at the University of Manchester and he was a frequent speaker at the

The reports he gave on these occasions were fully and carefully made, and his evidence was always very clear-cut and difficult to shake in cross examination. He was a keen politician, and had long been an active member of the Eccles and Swinton Parliamentary Division Conservative Association, of which he was president for ten years. He had been a county magistrate since 1930. He was a well known figure in Manchester and was always in demand as an after dinner speaker. There is no doubt that his loss will be keenly felt by many of his friends in Manchester and Eccles.

JOHN D MALCOLM, M.B. F.R.C.S. Ed
Consulting Surgeon Samaritan Free Hospital

Mr John David Malcolm, who was in former years well known in gynaecological circles died suddenly on March 20 at his home near Petersfield Hampshire where he had lived since retirement from active work. He was born on June 30, 1857, the son of John Malcolm, M.D., of Dundee and received his medical education at Edinburgh and Guy's Hospital, graduating M.B., C.M.E.D. in 1881, and obtaining the M.R.C.S. Eng. diploma in 1883 and the F.R.C.S. Ed. in 1884. After serving in turn as resident house-physician and resident surgeon at the Edinburgh Royal Infirmary he came to London and secured appointment to the staff of the Samaritan Free Hospital and after forty years service was elected consulting surgeon.

Mr Malcolm joined the British Medical Association in 1884, and was honorary secretary of the Section of Obstetrics and Gynaecology at the Annual Meeting of 1900 at Ipswich. He had held office as president of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine, and in 1913 was awarded the Liston Victoria jubilee prize by the Royal College of Surgeons of Edinburgh. He published in 1893 a small book on the physiology of death from traumatic fever, and had written a study in abdominal surgery.

A. H. T. ANDREW, M.B.

That corner of Suffolk between the Stour and the Orwell has been robbed by death of a devoted doctor and a great gentleman. Herbert Andrew was born in Northampton in 1883, educated at Bedford Modern School and St Edward's School, Oxford, and subsequently pursued his medical studies at Edinburgh University, where he graduated M.B., Ch.B. in 1910. Although a good footballer, holding a regular place in the Edinburgh University Rugby football fifteen, he was even in his undergraduate days a student of Nature and much of his spare time was spent as befits a student of bird life in collecting, photographing and stuffing ornithological specimens, he already loved his gun, rod, and artists' brush.

After qualification Andrew held various resident hospital appointments in Edinburgh, in Dublin, and at Northampton General Hospital, and finally settled in practice in Leiston, Suffolk where he remained for fifteen years. He held a commission in the Territorial Army, and on the outbreak of war was attached to the 1st East Anglian Field Ambulance, serving through the Gallipoli campaign in the famous 29th Division. He was subsequently transferred with that division to France, where he belonged to the 88th Field Ambulance and was also for a time attached to the 1st Royal Inniskilling Fusiliers. In 1917 and 1918 he worked in the casualty clearing zone first as an anaesthetist but finally realizing his laudable ambition of being appointed a surgeon he served in that capacity in the 53rd Casualty Clearing Hospital till the armistice.

In 1927 he relinquished his practice at Leiston but remaining faithful to the county of his adoption transferred to Holbrook, where in addition to his ordinary work he became medical officer to the Royal Hospital Naval School in that village, an appointment which he held till his death. He was a member of the Suffolk Branch of the British Medical Association.

Two years of almost constant association as a tent fellow during war-time cemented a friendship that death alone can destroy, and although the mileage may have precluded frequent meetings in the years of peace the writer retains a vivid memory of a debonair officer no matter how deplete of sleep and rest indefatigable self-sacrificing and the most charming companion in a surgical team that any surgeon could desire. His affability and charm enhanced our popularity as a visiting team to other clearing stations in times of battle. At the service at the graveside last week we were reminded by the clergy who knew him in private life of his kindness and of his fortitude, and the huge concourse which came to his funeral would have surprised one who was himself so modest, but the tribute nevertheless convinced the mourner of the matchless worth of our British general practitioner. His fortitude was perhaps best shown in his final illness for such were his sufferings that those who ministered to him can but rejoice that after his Calvary there his succeeded his Eastertide of peace.

G. GORDON TAYLOR

ROBERT GORDON MCKERRON, M.D.

Emeritus Professor of Midwifery University of Aberdeen

It is with deep regret that we record the death in his seventy fifth year, of Professor Robert Gordon McKerron at Edinburgh on March 21, after a brief illness. Born in Moray, he was educated in the University of Aberdeen graduating with honours both in arts and medicine later proceeding to the degree of M.D. After a short period as assistant to Dr Bruce of Dingwall he returned to Aberdeen and commenced general practice. At the same time he was appointed assistant to the professor of physiology in the University. Even at that time his chief interest lay in midwifery and he gave up the appointment in physiology to become assistant to the late Professor Stephenson who occupied the chair of midwifery. Until 1912 he conducted a strenuous general practice with specialization in midwifery and diseases of children, and held the posts of senior physician to the Sick Children's Hospital and physician to the Maternity Hospital.

In 1912 he was appointed to the Regius chair of midwifery in the University of Aberdeen and held this post until he resigned in 1936. In spite of his many duties he was able to carry a heavy share of the burden during the great war as a major in the Scottish General Hospital in Aberdeen. Until 1936 he was gynaecologist to the Royal Infirmary. He was the pioneer of ante-natal clinics in the North and served for many years on the Central Midwives Board for Scotland. In addition, he was a member of the British Medical Association for forty years, was a vice-president of the Section of Obstetrics and Gynaecology at the Annual Meeting in Aberdeen in 1914, and was president of the Aberdeen Branch from 1927 to 1929.

Robert Gordon McKerron will be remembered for many qualities. As a man he was sincere and direct to a degree. His vitality was amazing and in his younger days fatigue was unknown to him. The best of company he was the life and soul of any gathering, and no senior students' dinner was complete without his genial presence. As a teacher his lectures were dogmatic and practical leavened with a lively wit and he was adored by his

The Services

INDIAN MEDICAL SERVICE

REORGANIZATION UNDER NEW CONSTITUTION

The following statement received for publication from the India Office announces a reorganization of the Military Medical Services in India, which takes effect from April 1, 1937, the date on which Provincial Autonomy came into operation under the new Constitution

The changes in the organization distribution and terms of service which will be introduced are the result of a prolonged investigation extending over more than three years into the whole military medical organization both for peace and war. The main features are as follows

ESTABLISHMENTS

The strengths of the three military medical services in India—the R.A.M.C. borne on the Indian Establishment and the military branches of the I.M.S. and the I.M.D.—will be fixed so as to provide for the minimum medical requirements of British and Indian troops in peace

For the purposes of maintaining a War Reserve on which the Army in India must rely for its increased requirements in an emergency providing for attendance on British members of the superior Civil Services and their families and filling posts under the Central Government and the Crown Representative there will continue to be a Civil Branch of the I.M.S. recruited as hitherto from the military branch. It will consist of no fewer than 220 officers of whom 166 will be British

A new list of posts reserved for I.M.S. officers in civil employment has been adopted involving a net reduction in the number of posts so reserved for British and Indian officers from 207 to 172 but the existing rights of officers already in civil employment will be fully preserved and prospects equivalent to those afforded at present will be retained for them

RECRUITMENT

Recruitment for the I.M.S. will continue as at present to be conducted by nomination on the recommendation of a Selection Board. Indian members will be recruited in India and will normally be given short service commissions for five years after which selection will be made for permanent commissions from among those who desire to continue in the Service. British doctors will continue to be recruited in London and will be appointed to permanent commissions to all European vacancies. Selections will be held four times a year, as hitherto in April July October and December

PAY PROMOTION AND PENSION

Revised rates of pay for future entrants have been introduced so as to bring basic pay more into accord with Indian standards without materially altering the total emoluments which will be admissible to British members of the Service who draw sterling overseas pay. At the same time the time-scale of promotion to major has been accelerated by two years both for existing incumbents and new entrants. Improvements have also been made in the rates of pay drawn in the second, third, eleventh and twelfth years of service

An increased outfit allowance of £75 will be granted to new entrants and the maximum period of antedate for high qualifications and special experience is raised from one year to eighteen months

Six additional colonelcies will be provided on the military side of the I.M.S. and a suitable number of enhanced pension—equal to colonels' pensions will eventually be provided and awarded to officers on the civil side

CONDITIONS OF SERVICE IN CIVIL EMPLOYMENT

An officer transferred to civil employment will be on probation for two years. If continued in civil employ thereafter

he will retain a right to revert to military employment under certain conditions until he has spent seven years in civil employment or has had seventeen years total service after this period he will if it is agreed that he shall remain in civil employment be transferred to a special supplementary list and will not normally be eligible for military promotion above the rank of lieutenant colonel. This system follows that in vogue for other military officers in civil employ—for example, in the Indian Political Department

India Office March 24 1937

ROYAL NAVY MEDICAL CLUB

The twenty third annual dinner of the Royal Navy Medical Club will be held at the Trocadero Restaurant W. on Friday April 16 at 8 p.m. preceded by a general meeting at 7.30 p.m. Information can be obtained from the honorary secretary Surgeon Commander M. B. Macleod R.N. Medical Department Admiralty S.W.1

COMMISSIONS IN THE R.A.M.C.

The War Office announces that applications are invited from medical men for appointment to commissions in the Royal Army Medical Corps. Candidates will be selected for commissions without competitive examination and will be required to present themselves in London for interview and physical examination on or about April 22 1937. They must be registered under the Medical Acts and normally must not be over the age of 28 years

Successful candidates will in the first instance be given short service commissions for five years. During the fourth year of this period they will be given the opportunity of applying for a permanent commission. Those not selected will retire on completion of five years service with a gratuity of £1,000

Full particulars of the conditions of service and emoluments also forms of application may be obtained on application either by letter or in person to the Assistant Director General Army Medical Services, The War Office London S.W.1

KEOGH BARRACKS

The Army Council has decided to name the new barracks about to be built for the Royal Army Medical Corps Depot and Army School of Hygiene at Aldershot the Keogh Barracks in memory of the late Lieutenant General Sir Alfred Keogh G.C.B., G.C.V.O., C.H. That very distinguished officer was Director General Army Medical Services from 1905 to 1910 and again during the Great War from 1914 to 1918.

Medical Notes in Parliament

On March 25 before Parliament rose for the Easter Recess, the Royal Assent was given to the Consolidated Fund Act the East Hertfordshire Joint Hospital District Act the Waltham Joint Hospital District Act and the Wisbech Joint Isolation Hospital District Act. The House of Commons adjourned till April 6 and the House of Lords till April 7

The Public Health (Drainage of Trade Premises) Bill was read the third time and passed by the House of Lords on March 23. On the same day the Marquess of Dufferin and Ava introduced a Bill to provide for the regulation of the fumigation of premises and articles by hydrogen cyanide. The Bill was read a first time

In the House of Commons on March 23 Mr. Baldwin introduced the Ministers of the Crown Bill. The object of the Bill is to regulate the salaries payable in respect of certain administrative offices of State to provide for the payment of additional salaries to members of the Cabinet holding offices at salaries less than £5,000 a year, of a salary to any person being Prime

Minister of pensions to persons who have been Prime Minister and of a salary to any person being Leader of the Opposition and to simplify the law as to the capacity of persons holding offices of profit to sit and vote in Parliament. On the same day the National Health Insurance Act (Amendment) Bill was read a third time in the Commons. It had been read a second time on March 22.

The annual report of the Department of Health for Scotland (1936) was presented to Parliament on March 23.

The Conservative Committee on Nutrition was addressed at the House of Commons on March 24 by Lord Astor on the examination of nutrition problems abroad and at the League of Nations.

An Order for Alteration of Coroners Districts in the County of Denbigh was laid on the table on March 24.

On March 24 the Northern Group of M.P.s received a deputation about the report of the Select Committee on the Medicine Stamp Duties. The deputation which was from the Newcastle and Northumberland Branch of the Pharmaceutical Society of Great Britain argued that it was unfair for everyday medicines and medicaments to be taxed because advisory directions were printed on the labels. The committee promised consideration of the matter.

Housing in Scotland

On March 23 Mr Elliot told Mr Mathers that he had conferred with employers and operatives representing practically all the organizations in the building industry in Scotland. Information had been placed before the building industry showing the public work (including houses, schools and hospitals) that it is desired to carry out within the next few years. It was his intention to submit proposals to Parliament at the appropriate time for the continuance of the present rates of Exchequer contributions under the Housing (Scotland) Act 1930 and the Housing (Scotland) Act 1935 for the three years beginning on April 1 1938, that was to March 1941. He was arranging for meetings with the Association of Local Authorities to discuss the question of planning their building programme so as to ensure the maximum degree of continuity of progress. A preliminary meeting was held in Edinburgh that morning. A further meeting with the representatives of the building industry was being held in Glasgow that day. He had every reason to think that when the negotiations were concluded there would be made possible a marked improvement in the recent rates of house building.

Extension of Subsidies for Slum Clearance

Pepping on March 23 to Mr Wilfrid Roberts Sir Kingsley Wood said that under Section 102 of the Housing Act 1936 he was empowered to review after October 1 1937 in consultation with the local authorities the Exchequer contributions payable for clearance and the abatement of overcrowding. The Act provided that contribution at the existing rate would be payable for houses completed by March 31 1938. The completion of the clearance and the abatement of overcrowding are vital elements in the health crises of the country. He was anxious to preserve the continuity in the housing programme. What subtle and error it was to mention a change in the provision under which the Exchequer contribution would continue without referring to the houses built in replacement of the cleared ones for the abatement of overcrowding which were completed. December 31 1938.

inquiries about the date on which the National Health Insurance scheme would be amended to bring in young persons on entry into employment.

Mr DAVIS: Are we right in assuming that the medical profession's objections to the fee that has to be paid in the case of these boys and girls are holding up the Government's legislation?

Mr HUDSON: No Sir. I said in my reply that the matter had been connected with the larger question of fees and that my right hon. friend had agreed to the suggestion that the whole matter should be referred to an independent court of inquiry.

Mr DAVIS: Is it not a fact that the medical profession declined to accept the offer of the panel fee suggested and because of that the medical profession is holding up the Government's legislation?

Mr HUDSON: That is not altogether a complete description.

Report on Medicine Stamp Duties

On March 25 Mr I. C. HANNAH asked the Chancellor of the Exchequer before deciding to adopt the duties recommended by the Select Committee on Medicine Stamp Duties to consider that the comprehensive taxes on medicines proposed by the Committee would affect the poorer classes while hardly touching the rich and that the small chemists took objection. Col COLVILLE replied that before Mr Chamberlain reached a decision on the Committee's report due weight would be given to all relevant considerations.

Midwives Act: Qualifications of Midwives

On March 25 Mr VINEY asked whether the Minister of Health in issuing regulations in connexion with the Midwives Act instructed medical officers of health when making appointments to confine such appointments to those who possessed a certificate in midwifery and also the certificate of a State registered nurse. Sir KINGSLEY WOOD answered that the Midwives Act 1936 did not empower him to issue regulations with regard to the qualifications of midwives to be appointed under the Act. In the circular which he addressed to local supervising authorities on September 18 1936 he drew attention to the importance of absorbing into the new service as many as possible of the independent midwives at present in practice. The circular made no suggestion that appointments should be confined to midwives who were State registered nurses. He added that he deprecated any such limitation in the appointments first made by local supervising authorities under the Act.

Insured Persons Not Choosing a Panel Doctor

In each of the five years 1932 to 1936 the number of insured persons in England and Wales who, although entitled to medical benefit, had not chosen an insurance doctor, was on the average about 495,000. Sir KINGSLEY WOOD cannot give a similar figure of the number of persons who have chosen a doctor but have not used his service.

Cord Room Workers' Committee on Compensation

Sir JOHN SIMON has appointed a committee to consider and report with regard to an equitable and workable scheme to be devised for providing compensation in the case of persons who after employment for a substantial period in cord room work suffer from a disability as part of cotton spinning mill disease. He had been directed by the respiratory illness as indicated in the report of the Departmental Committee on Cough and Cord room workers and if it is made detailed recommendations for provision to be included in the scheme more extensive provision to be made for persons to whom benefit should be payable.

Dispensing Under National Health Insurance Act—In the House of Commons on March 23 Sir KINGSLEY WOOD moved the Second Reading of the National Health Insurance Act (Amendment) Bill. He said that the Bill was virtually a drafting amendment to a section of the National Health Insurance Act 1936 which prescribed the class of persons entitled to undertake the dispensing of medicine under that Act. Section 41 of the Act described these persons by a reference to their rights under the Pharmacy and Poisons Act to use the title of chemists and druggists. It had been found that these words did not meet the case of corporate bodies, and to enable these corporate bodies, employing qualified chemists, to participate in the insurance scheme the Bill had been introduced. The Bill was read a second time.

Model Diets in Mental Hospitals—Sir KINGSLEY WOOD on March 23 informed Mrs Tate that a number of mental hospitals had adopted a dietary for a four week period though he was not aware of the exact number. The matter was determined by the visiting committee of the local authority generally on the advice of the medical superintendent. The standards recommended by the Committee on Diets had been generally adopted.

Salary Limit for Unemployment Insurance—Mr ERNEST BROWN told Mr Dingle Foot on March 24 that he had taken note of the request from the National Federation of Professional Workers for the raising of the salary limit in unemployment insurance to £500 a year. The Secretary of the Federation Mr Brown added had been informed that the question was under consideration.

Alleged Infection in Imported Eggs—Sir JOHN WARDLAW-MILNE declared on March 25 that the superintendent of one of the Japanese Government hygienic institutions reported that Chinese eggs had been found in certain instances to contain the bacilli of tuberculosis, of syphilis and of typhoid fever. Sir John asked what action had been taken in this country to ensure that eggs of this kind imported here were not so infected. Sir KINGSLEY WOOD did not know of this report but promised to have inquiries made. He added that examinations of Chinese eggs made in the laboratory of the Ministry of Health had not revealed the presence of any disease producing organisms.

Spirochaetal Jaundice—Sir JOHN SIMON told Mr Windsor on March 25 that the drafting of the Order scheduling spirochaetal jaundice as an industrial disease, as recommended by a Home Office Committee had been found to raise points of difficulty. These were being gone into and he hoped the matter would be settled at an early date.

The Case for Quinquennial Census—With regard to representations made to the Ministry of Health by a scientific deputation by the Royal Statistical Society and by the Association of Medical Officers of Health in favour of a quinquennial census, Mr CECIL WILSON asked how far these representations had received favourable consideration and whether in view of the rapidity with which changes in the location and occupation of the population were taking place and the necessity for accurate information the Minister of Health would consider the desirability of taking the census quinquennially. Sir KINGSLEY WOOD said he had received no representations on this subject recently. A census was due to be taken in 1941. After that date the question of a quinquennial series will be reviewed.

Notes in Brief

Draft regulations under the Petroleum (Consolidation) Act 1928 to control the conveyance by road of a number of dangerous substances including sulphuric acid have been prepared in consultation with the interests affected and will soon be issued.

The report on home-work set in schools is now in the hands of the printers but is unlikely to be published before the end of May.

Medical News

It is officially announced that H.M. the Queen Com-mandant-in-Chief of the Nursing Corps and Divisions of the St John Ambulance Brigade has appointed H.R.H. the Duchess of Gloucester as her Deputy. Her Royal Highness is a Dame Grand Cross of the Order of St John and is the third member of the Royal Family to hold an official and active appointment in the Brigade.

A ball in aid of St Bartholomew's Hospital will be held at the Dorchester Hotel, Park Lane, W.1, on Tuesday April 20. There will be dancing from 10 p.m. till 3 a.m. with cabarets, sideshows, etc. Tickets (inclusive of dinner with champagne and buffet) are two guineas each obtainable from St Bartholomew's Hospital, or the Dorchester Hotel, or the organizer of the ball (Mrs Madge Clarke 20, Bruton Street, W.1).

The annual oration before the London Jewish Hospital Medical Society will be given by Professor Simson Wright, M.D., on Thursday April 8, at 4 p.m. at the London Jewish Hospital. His subject is Social Organization in the Living Body.

A meeting of the Listerian Society of King's College Hospital will be held in the lecture theatre at the hospital Denmark Hill S.E., on Wednesday April 7 at 8.15 p.m. when Sir Walter Langdon Brown will give an address on The Integration of the Endocrine System. Medical students and practitioners are invited to attend.

A meeting of the Committee for the Study and Investigation of Rheumatism will be held at the Red Cross Clinic Peto Place, W.1, on Tuesday, April 6, at 5.30 p.m. Cases will be shown, and an invitation to be present is extended to medical practitioners interested in the subject.

A course in laryngology and phonetics will be held in the Bellan Hospital Rue de Tével 7 Paris from Monday May 31, to Saturday, June 5, by Dr J. Tarneaud (oto-rhino-laryngologist to the hospital), with the assistance of Drs R. Husson, P. Kucharski and Mme Borel Maisonnay. The course will comprise clinical and cinematographic demonstrations, in addition to lectures on the associated pathological, therapeutic, and educational considerations. The fee is 200 francs and fuller information may be obtained from Dr Tarneaud, Avenue de la Grand Armée 27 Paris XVI.

A practical and theoretical course in broncho-oesophagoscopy will be held at the Hôpital Lariboisière, Paris from May 10 to 15 under the direction of Dr André Aubin. The fee is 500 francs. Further information can be obtained from 17 Rue du Fer à Moulin Paris.

The new building for the Helen Chambers Research Laboratories, which Queen Mary opened on March 19 at the Marie Curie Hospital (see *Journal* March 27 p. 678) is situated between the two existing blocks of the hospital to which it has direct access by means of covered ways. The laboratories which occupy its upper story have been planned to afford facilities for carrying out the routine pathology of the hospital, as well as for the development of work in cancer research with particular regard to the experimental approach. One laboratory is equipped for routine clinical pathology and histology. Separate rooms are provided for bacteriology and for biochemistry. Two rooms are equipped to house animals for work in experimental pathology and the pathologist's private room is also fitted as a research laboratory. A sterilization room and a room for the preparation of media and a mess room for the technical assistants complete the unit which is in charge of Dr Mary Gilmour under the general direction of Dr Elizabeth Hurdon.

The chairman and treasurer of the General Infirmary at Leeds stated at the annual meeting of the Governors that for the first time in twenty five years the Infirmary had been able to balance its budget.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, W.C.1.

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association, House, Tavistock Square, W.C.1, on receipt of proofs. Authors over seas should indicate on MSS if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS, as well as orders for copies of the *Journal*, should be addressed to the Financial Secretary and Business Manager.

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

The TELEGRAPHIC ADDRESSES are

EDITOR OF THE BRITISH MEDICAL JOURNAL *Amology*
Westcent London

FINANCIAL SECRETARY AND BUSINESS MANAGER
(Advertisements etc.) *Articulate Westcent London*

MEDICAL SECRETARY *Mediscara Westcent London*

The address of the B.M.A. Scottish Office is 7 Drumshough Gardens, Edinburgh (telegrams *Associate Edinburgh* tele. phone 24361 Edinburgh) and of the Office of the Irish Free State Medical Union (I.M.A. and B.M.A.) 18 Kildare Street, Dublin (telegrams *Bacillus Dublin* telephone 62550 Dublin).

QUERIES AND ANSWERS

Broken Sleep in Middle Age

NORTHERN IRELAND, in reply to SUSSEX (*Journal* March 20 p. 649) writes: "I would not advise sedatives on account of his debility and low blood pressure. Many professional men and especially Stock Exchange brokers suffer from an inability to banish work and prices from their minds on retiring with the result that the first exhaustion over their brains brings them to the surface again in the small hours. I should advise a light meal not later than two hours before retiring and a cutting down to the minimum of alcohol and tobacco. Deep breathing exercises with complete muscular relaxation should be begun and then a few simple raising and bending exercises for trunk and legs should be introduced. If the heart is sound these should be performed vigorously until the patient is slightly out of breath and in a week the gain in vitality will be amazing. The whole thing should not take more than ten minutes in the bedroom and afterwards sleep should be continuous till 7 a.m. If however the patient still wakes at 3 a.m., I should instruct him to get up and walk round the room in night attire breathing deeply until he begins to feel chilly. He should then get into his warm bed and the grateful heat should soon settle him off. I would also suggest warm bed socks and two anti-stasis pills on retiring."

Painful Feet

PERPLEXED would welcome suggestions in the following case. A lady aged 69 had typhoid fifty years ago. Since then she has suffered from painful feet. Locomotion is only possible by walking on the heels. In the right foot the third metatarsophalangeal joint which protruded into the sole was treated operatively and the nerves sectioned but the pain persists. Both arches are flattened. All varieties of shoes with special insoles have been tried without avail. Callusities are present especially on the pads and the large toe joint. Chiropody is invoked periodically and various orthopaedic surgeons have been consulted. Are there such aids as pneumatic soles available?

Income Tax

Proportion of General Expenses

"G" occupies a house which has six rooms and a garage on the ground floor and eight rooms up stairs. The garage and four downstairs rooms are used for patients. The Inspector of taxes refuses to continue the previous allowance of one-half the rent rates etc. as applicable to the practice. "G" keeps a cook and two maids and a regular refusal has been met to the claim for one-half the cost as Luther's.

As regards the rent, a man cannot tax his rooming board in the ground floor of a house if all his services are

to have a higher letting value than the upper floors and advise "G" to adhere to his claim and press it to appeal if necessary. With regard to the domestic service, however, one maid is normally considered adequate for looking after the professional use of the premises and "G" may be wise to compromise on a deduction of one third instead of the former one half.

LETTERS, NOTES, ETC

Herpes Zoster and Varicella

Dr J. G. BENNETT (Hyde, Cheshire) writes: "The following case of coincident herpes zoster and varicella will possibly interest readers of the notes in the *Journal* in the past few months. Although the conditions are closely connected it has not up to the present been established how this correlation works. We have proof that an epidemic of chicken pox is frequently present when herpes zoster is prevalent but it has not been my lot to see the two lesions occur in one person at the same time. A chemist aged 36 consulted me in regard to severe neuralgia in the right side of his head. There was no apparent cause for his neuralgia and I prescribed an aconite and gelsemin mixture. He returned in a few days no better and was then given luminal sodium grain 1/2 t.i.d. which seemed to afford some relief. A week later he developed a severe attack of right-sided herpes zoster of the fifth nerve and became very ill with vesicles all over the right side of his forehead and cheek which rapidly involved the eyelids and caused a keratitis of the globe of the eye. He was given 1 ccm of pituitrin. On the following day he taxed me with having caused a rash to break out on his body as a result of my injection. The rash proved to be a typical papular varicella which later developed true pustules. There were a few pustules on the hard palate and quite a number have left pitted scars on the chest. Coincidentally the herpes zoster is clearing up rapidly and the keratitis is also resolving. It seems to me to be very interesting to find the two conditions occurring practically *pari passu* although I am at a loss to understand the connexion between them."

What About Ourselves?

Dr C. J. HILL (Aitken, Kollerhahn) writes: "Lord Horder asked 'And what about ourselves?' in his Hunterian Oration (*Journal* February 27 p. 462). Some years ago I was told by a doctor as an example of how the South African native believed in magic that following the examination of a child's throat with a tongue spatula the father of the child told his friends how the doctor had cured the child's sore throat by looking inside the mouth of the child. Thought of this came to me as I examined a quinsy and noticed pus oozing from the supratonsillar fossa above the right tonsil side of the quinsy. The light was good the patient opened his mouth satisfactorily and the tonsil had been clean when I started the examination with a spoon. Evidently depressing the tongue caused the opening into the fossa to gape and so pus could escape. The patient volunteered the information that the spoon examination gave him relief on each occasion. What I observed in this case would account for a patient who tells me he cured his quinsy by swallowing half an orange. The bulk of the half orange presumably would depress the tongue and so open the mouth of the fossa and allow the pus to escape."

Late Menopause

Dr D. J. CONOLLY writes: "The following menstrual history may be of interest to the profession. A woman now 74 years old started to menstruate at or about the age of 11. The menopause finally ended when she was 72. She married when 15 years of age and had had four children by the time she completed her twenty-fifth year. Three of these are still living the fourth died in infancy. Her husband died a teen years ago. There was no further issue of the marriage. She menstruated regularly up to her sixtieth year and during the last twelve months of the menopause the menses were irregular until their final cessation. She breast fed her children well after the first child's lactation the last increased in size very much and have remained large to the present day. There was no artificial method for married life or contraceptive method tried. The point to be noted are (1) that the sudden cessation of reproduction (2) the hypertrophy of the mammae and (3) the late age of the menopause."

G BASSI (*Pohclunco*, Sez. Med., February 1, 1937, p. 87) records his observations on 750 cases of heart diseases which were found on examination of 15,000 soldiers, aged from 20 to 25, during the period May, 1935, to September, 1936. In a large proportion of cases a rheumatic origin could be found, though the exact figures are not given. Infection of the tonsils was also an important causal factor, and a considerable number of patients attributed their disease to an acute respiratory infection. In the remainder there was no history of any disease likely to be a factor in the production of the cardiac condition. Lesions of the mitral valve were most frequent, insufficiency being commoner than stenosis, while the incidence of aortic disease was low, and only a few examples of combined mitral and aortic disease were found.

I. HOLMGREN and B. LINDSTRÖM (*Hvgiea*, Stockh., January 31, 1937, p. 48) have studied the reactions to vaccination of 513 adults, only fifty of whom had been vaccinated recently. They classified the reactions in three groups according to their severity, the third group including the cases in which pustules formed, while the two first groups included the comparatively mild reactions indicative of some pre-existing degree of immunity. A classification of the persons vaccinated according to the length of the interval between the present and the last vaccination brought out the fact that the longer this interval the greater the proportion of cases in which the reaction was pustular and the temperature was raised over 100° F. But even when this interval was longer than forty years only 54 per cent of 208 men and 62 per cent of 225 women responded with pustular reactions. The percentage of adults vaccinated for the first time responding with a pustular reaction was considerably higher (74 per cent of the men and 81.5 per cent of the women). This suggests that in a high proportion of cases the benefits of vaccination still exist more than two score years later. Another of the authors' conclusions based on their statistical study is that the younger the person vaccinated the more complete and lasting is the immunity he enjoys. They also find that vaccination does no harm to persons suffering from various diseases, and one of the authors (I. H.) refers to his experiences during the small-pox epidemic in Stockholm in 1913 when he vaccinated without ill effects some 200 patients suffering from advanced tuberculosis. He argues that acceptance of the doctrine that only the well should be vaccinated is dangerous as it entails the provision of a group of susceptible persons calculated to promote the spread of small pox in time of epidemics.

N. DUNGA (*Ukrskr. Læge*, February 4, 1937, p. 134) gives an account of immunization against diphtheria in Iceland where its almost complete disappearance since 1926 has bred a generation of children susceptible to this disease. Schick tests conducted in 1932 and again in 1935 among school children showed that between these two dates the percentage of negative reactors already remarkably low in 1932 had declined still further. At the age of 8 years only 14 per cent of the children tested in 1932 were Schick negative and this figure for the 8-year-old children was reduced to about 10 per cent in 1935. It was therefore feared that with such a high proportion of Schick positive children the next epidemic of diphtheria would be very dangerous. A case of

diphtheria which occurred in December 1934 and which proved fatal within twenty-four hours gave the signal for wholesale immunization of children which was partially effected with Ramon's anatoxin from the Pasteur Institute and partly with preparations of anatoxin from the State Serum Institute in Copenhagen. During 1935 there were forty-one cases of diphtheria, the epidemic culminating in April with twenty cases. By the end of April some 5,000 persons had each been given one or two injections and the author claims that the almost complete cessation of the epidemic at the end of April must largely be attributed to this prophylactic treatment. During the fourteen months dating from May 1935 only three cases of diphtheria occurred among artificially immunized persons, whereas there were eighteen cases among persons not thus immunized. As 65.5 per cent of all the children under the age of 13 had been treated with anatoxin the author concludes that its prophylactic action was considerable.

S. STAHL (*Nord med. Tidsskr.* January 23, 1937, p. 121) gives an account of an outbreak of tuberculosis in human beings in Sweden traced to a cow suffering from tuberculous mastitis. The outbreak began at the end of August 1936, when several children developed fever and such signs as enlargement of the cervical glands, erythema nodosum, phlyctenules, etc. Altogether there were twenty-five who showed definite evidence of infection and twenty-five others whose development of a positive tuberculin reaction was indicative of a recent infection. A search for human sources of infection proved negative but the fact that most of the positive tuberculin reactors and the children with signs of active tuberculosis had been supplied with milk from one and the same herd led to a careful examination of its cows and of the persons in attendance on them. This herd had previously been examined by a veterinary surgeon, who had found all the twenty-two cows clinically healthy. But when they were re-examined one was slaughtered as the milk from it contained tubercle bacilli. Post mortem examination revealed tuberculous mastitis as well as tuberculous foci in the lungs. The lesson the author extracts from this outbreak of tuberculosis and from the investigations to which it led is that the so-called clinical examination of cattle by veterinary surgeons is no effective guarantee against infection of the milk from a tuberculous focus in an udder. Such a focus may develop suddenly and be very difficult to detect by clinical examination. Only the cows found to be definitely free from tuberculosis by such tests as the tuberculin reaction can be relied on to supply tubercle-free milk.

L. FRANKENTHAL (*Zbl. Chir.* January 23, 1937, p. 211) reports a case of severe Dupuytren's contracture treated with a skin graft borrowed from the little finger. The whole of the palmar aponeurosis with its extensions was excised, the bones of the little finger disarticulated and the skin flap less the nail used to cover the extensive skin defect. The result proved satisfactory.

G. MONTENAPPI (*Pohclunco*, Sez. Chir. January 15, 1937, p. 12) reports a case in a girl aged 10 years who in that while traction combined with massage and active and passive movements, tenotomy and neurolysis did not succeed in correcting the deformity and still less in restoring normal function, resection of 2 cm. of the radius and ulna at different levels produced a remarkable im-

provement. The writer maintains that though non surgical methods may succeed in mild cases and periarthral sympathectomy may suffice in cases of spasm which are not true contractures in true and inveterate cases of Volkmann's contracture resection as above can yield good results.

255 Scalenotomy for Cervical Rib

G WILBERG (*Nord med Tidskr* January 9 1937 p 58) confirms the favourable impressions of Adson and Coffey of the operation devised by them and consisting of division of the scalenus anticus at its attachment to the first thoracic rib. This enables the surgeon to dispense with resection of the offending cervical rib. The author gives an account of a telephone operator on whom he performed this operation. In January 1936 a cervical rib on the left side was resected with considerable relief of the symptoms on this side. She returned in July of the same year with symptoms of cervical rib on the right side the pain in her right arm being such that sleep was disturbed and she had to cease work. The radiological and clinical examinations indicating a cervical rib on the right side scalenotomy was performed on this side under local anaesthesia. The lower end of the scalenus anticus was remarkably large and its division made a 4 cm wide gap between bone and muscle. The patient was able to resume work between two and three weeks after the operation and it was only after exceptionally tiring work that she was subject to slight aches and pains on both sides. There were no symptoms when she attended to ordinary domestic duties on holidays. This case suggests that neither resection of a cervical rib nor scalenotomy by itself is capable of completely relieving the pressure on the brachial plexus

256 Sterilization of the Male

BOEMINGHAUS (*Z Urol Bd 31, Hft 2 1937, p 84*) points out that for eugenic purposes in sterilization of the male efficiency must be combined with the minimum disturbance. Almost all incisions giving access to the vas deferens are equally good. The litter must be freed from its coverings. The author fixes the vas with a special clamp percutaneously before incising the skin. 1 to 2 cm of the vas must be resected. The ends may be ligated or left free. Simple vasotomy is not a safe method. The author advises that the resected piece should be bottled and labelled for reference. In rare instances histological examination may be required to prove that vasectomy has indeed been performed. Patients are kept in hospital for four to five days. In fourteen days the scar can hardly be seen. Boeminghaus draws attention to the fact that the length of life of spermatozoa is unknown and that it is difficult to keep patients in hospital for a long period after sterilization to express sperm digitally per rectum or to demand two or more voluntary ejaculations before discharge. He advises the injection of 1 in 1000 solution of rivanol through the vas. Rivanol kills the spermatozoa immediately and washes them away if sufficient solution is used to fill the seminal vesicles and overcome the valvular mechanism of the ejaculatory duct. Malformations of the parts must be borne in mind so that success may be assured. The operation may be reversed at a later date by removing the fibrosed ends of the vas and suturing them end-to-end over a catgut thread to ensure patency. In dogs this operation is successful in 50 per cent of cases and the author believes that owing to better anatomical conditions in man the prognosis is even better.

257 Breast Tuberculosis

J KEELEY (*Br Med J* February 1937 p 164) presents four cases of tuberculosis of the breast and points out that this lesion constitutes about 1 per cent of all the breast tumours. Cases are classified as primary or secondary and in the former group the disease is attributed to infection entering through the ducts skin abrasions or blood stream while secondary cases are said to derive from a focus of lymphatic

or contiguous structures. Trauma probably plays a part in so far as damaged tissue constitutes an area of lessened resistance. The disease is most common in females and half the cases occur between the ages of 20 and 40. The lesion is usually unilateral and in most cases the discovery of a lump in the breast is the earliest symptom. Pain is seldom noticed. The nodular type of growth tends to remain localized the confluent type is seen in cases where coalescence of involved areas has occurred whilst the intraglandular cold abscess is a variation of the latter type and represents a more effectively walled-off process. The sclerosing type is rare and occurs in older patients and may cause deformity of the breast. Early invasion of the axillary nodes is characteristic of the disease, as is also the presence of a fistula discharging a gritty caseous material. In the four cases reported a correct diagnosis was made in only one case, the other cases being diagnosed as chronic mastitis carcinoma and adenofibroma. Treatment should be surgical and consists of removing the local process. If multiple sinuses are present and there is invasion of the axillary nodes a radical mastectomy may be necessary. Early operation is advisable as in these cases local excision will suffice. In the four cases described operation was successful and the patients recovered satisfactorily. Recurrence after operation in cases of tuberculosis of the breast is uncommon.

Therapeutics

258 Insulin Shock in Bronchial Asthma

J WEGIERKO (*Wien klin Wschr*, February 12 1937 p 195) describes a series of cases of bronchial asthma treated with insulin shock. He finds that insulin shock interrupts dyspnoea in bronchial asthma and that after a series of shocks the asthmatic type is changed and the attacks become less frequent and in many cases disappear altogether. In certain severe cases shock has to be administered daily. Neither exhaustion of the patient nor complications following the frequent administration of insulin were noted. The shock induced by the author is mild. Hypoglycaemic coma does not result. Fasting patients receive 40 units of insulin but 80 to 100 units may be required after meals. Wegierko states that the pyrexial treatment of asthma with injections of milk or colloidal sulphur is a far more serious undertaking than his method of insulin shock. He is unable to state exactly why cessation of dyspnoea occurs but he believes that the insulin shock increases the tonus of the parasympathetic nervous system so that it gets the upper hand over the sympathetic nervous system. It is at this point that clinically the bronchial spasm is eased. The antispasmodic action of insulin is probably cumulative which accounts for the cessation of attacks altogether in a number of cases.

259 Serum Treatment of Whooping-cough

J M DA ROCHA and J A B N DE GAMA (*J Pediatr* December 1936 p 558) state that the best modern works on paediatrics and infectious diseases contain only a few references to the serum therapy of whooping-cough apart from convalescent serum and express a negative opinion as to its value. Klemento was one of the first to inject horses with cultures of *H. pertussis* sterilized at 56°C. The results obtained by injection of doses ranging from 30 to 50 c.c. in 35 cases were encouraging as the number of attacks diminished especially at night there was an improvement in the general condition complications were fewer and the duration of the disease was shortened. Favourable results were also obtained in over 150 cases by Duthoit with a serum prepared by Bordet and Gengou. These results have been confirmed by subsequent observers. The writer's own record their observations on five cases of whooping-cough in children aged from 6 months to 5 years have been treated by injections of a serum of equine origin obtained from animals immunized against pertussis. The results were encouraging but on only one child of 18 months

the number varying from three to six. Diminution of the attacks occurred immediately in each case. Further observations are required to determine the value of the treatment and especially control observations in cases treated by normal serum only.

260 Pernaemon in Melancholia

J. A. T. LIGTERINK, C. SIMONS and N. SPEIJER (*Nederl Tijdschr Geneesk*, February 20, 1937, p. 768) state that in view of the fact that in melancholia, especially of the involuntional type, the cholesterol content of the serum is increased, Georgi used injections of the suprarenal preparation suprascortine in cases of melancholia, with the result that he obtained not only a reduction of the amount of cholesterol but also an improvement in the physical condition. The present writers, however, who used the liver extract pernaemon which has a similar action to suprascortine, obtained a reduction of the cholesterol in nine cases of involuntional melancholia but without any effect on the mental condition. The therapeutic results therefore, obtained by Georgi cannot be attributed solely to alterations of the blood cholesterol.

Neurology

261 Cerebro-spinal Fluid in Epilepsy

Continuing their investigations into the pathology of 'essential' or idiopathic epilepsy, W. G. LENNOX and H. H. MERRITT (*J. Neurol. Psychopath.* October 1936, p. 97) have investigated the changes in the cerebro-spinal fluid in this condition. They studied over 800 patients, in whom a rigorous neurological and physical examination together with x-ray and laboratory investigations had excluded as far as is possible an organic cause for the fits. The authors state that they realize that it is impossible on the basis of an examination short of the post-mortem table to exclude with accuracy all such cases. Taking a pressure of 70 to 180 mm. of cerebro-spinal fluid as normal they found that 10 per cent of their cases had an abnormally high pressure, although only 1 per cent had a pressure of over 250 mm. Similarly accepting 45 mg. of protein per 100 c.c. as the upper limit of normality when the Denis-Ayer method is used they found that 10 per cent of cases of essential epilepsy had a cerebro-spinal fluid protein content above that in normals. There was a slight pleocytosis (6 to 10 lymphocytes) in 4 per cent of the cases. The concentrations of sugar, chlorides, calcium and non-protein nitrogen were within normal limits. As the only abnormalities found were a slight increase in the pressure and in the protein content in 10 per cent of cases it follows that any marked abnormality in the pressure or the contents of the fluid makes the diagnosis of essential epilepsy hazardous.

262 Acetylcholine in Anxiety States

M. S. SHAW (*J. ment. Sci.* November 1936, p. 785) has administered carbaminacetylcholine chloride (dorvil) to six patients suffering from acute attacks of anxiety. He reports a diminution in their subjective and objective symptoms during the administration of the drug, with a relapse on its cessation. He states that evidences of sympathetic overactivity elicited before administration of dorvil were diminished during its exhibition. He concludes that his work offers further evidence in support of the hypothesis that the somatic symptoms found in anxiety states are referable mainly to imbalance of the autonomic nervous system.

263 The Premotor Syndrome

A. T. ROSS (*J. nerv. ment. Dis.*, January, 1937, p. 1) has reviewed the problem of the premotor syndrome. This name has been given to the association of spastic hemiplegia with increased reflexes, disturbance of skilled movements, forced grasping, and transient vasomotor disturbances. The experimental work of Fulton in extirpating different combinations

of Brodman's areas 4 and 6 on both sides in anthropoids has led to the attribution to the premotor cortex (area 6) of many functions involving the use of extrapyramidal and autonomic pathways. It has been difficult to dissociate the effects of damage to the motor cortex from those due to experimental removal of the premotor cortex and there are many who agree with Walshe that practically everything in Fulton's syndrome can be explained on the basis of lesions in the true motor cortex. The distinction of flaccid and spastic paralysis with the help of which Fulton differentiates lesions of the premotor from lesions of the motor area is held by Walshe to depend on the age and severity of the lesion and not on its anatomical site. Thus acute lesions of the motor cortex result in a flaccid paresis which in time changes into a true spasticity with hyperreflexion in the absence of any involvement of the premotor cortex. There remains however the grasp reflex and the motor apraxia which are seen in patients suffering from lesions of the premotor cortex and which do not appear to arise after lesions of the motor cortex. The problem of the premotor cortex must still be openly discussed until more facts are known which will bring clinical experience into line with experimental findings.

264 Treatment of Cerebral Abscess

EDGAR A. KAHN (*J. Amer. med. Ass.* January 9, 1937, p. 87) has reported four cases of intracerebral abscess which have been successfully treated by a conservative surgical technique. The primary septic focus having been treated and the abscess localized clinically, a small trephine opening is made over the suspected area and the abscess sought for by exploration with a blunt cannula. Some pus is removed and the cannula withdrawn. Then the author enlarges the trephine opening to about 4 cm., opens the dura with a stellate incision and coagulates the cortical vessels which are visible. He then inserts a light iodoform pack to encourage arachnoid adhesions. This operation is performed under local anesthesia. Three to four days later the superficial or dementous cortex which has herniated through the trephine hole is sucked away and it is found that the abscess which was several centimetres below the cortical surface is presenting at the trephine hole. The choice of drainage of the superficial abscess or complete removal of its capsule can then be made. To prevent excessive herniation lumbar punctures and dehydration therapy are used. If the abscess has not presented sufficiently at the trephine opening a few more days may be given before it is opened or removed. The advantage of the method is that deep abscesses can be removed with little interference to the surrounding brain tissue.

265 Inheritance of Epilepsy

H. A. PASKIND and M. BROWN (*Arch. Neurol. Psychiat.*, Chicago, November 1936, p. 1045) have investigated the incidence of epilepsy in the offspring of epileptic parents who have not required institutional treatment. They point out that most of the statistical reviews of the incidence of epilepsy in the children of epileptics have come from patients massed together in institutions. Here there is a highly selected group of patients in whom mental change has often taken place and in many of whom there is a neuropathic stock. There is however a much greater number of epileptics who do not require institutional care but who live a normal life and beget normal children. Paskind has previously shown that only 6.5 per cent of these patients show any mental deterioration. A review of the literature shows wide variations in the numbers of affected children of epileptic parents; the authors quote percentages varying from 1 to 25. It would appear however that between 5 and 8 per cent of the children of parents who have required institutional treatment for epilepsy eventually develop epileptic manifestations. In the present investigation 370 children of 162 epileptic parents receiving treatment in private practice were followed up. The great majority were between 5 and 25 years of age. Of the 342 children living only one had epilepsy and six had

had infantile convulsions. None of the twenty-eight children who had died had manifested signs of epilepsy. This low incidence (0.3 per cent) of epilepsy occurring in the offspring of otherwise normal epileptic parents makes the hereditary prognosis much better than one has been led to believe from a study of statistics based on the institutional class of patient.

Obstetrics and Gynaecology

266 Postmenopausal Bleeding from a Theca-cell Tumour

H. HUBER (*Zbl. Gynäk.*, January 2, 1937, p. 14) adds one more to the list of theca interna cell connective tissue ovarian tumours of which Loeffler and Priesel (the original reporters) have now described ten and American writers seven. His patient, a woman aged 67 had had irregular metrorrhagia for three months and showed recent growth of a beard and general cutaneous pigmentation. For those reasons and because the urine contained follicular hormone and the endometrium showed glandulo-cystic hypertrophy the conclusion is drawn that the tumour was the site of active hormone production. It contained a large solid part as well as a pseudo-serous cyst and the cytological characters of the former pointed to its malignancy. The patient was free from recurrence after nine months. Microscopically the solid portion consisted of a richly cellular tissue containing giant cells and an abundant connective tissue network. Lipoids were present in the cytoplasm. A functional resemblance to granulosa-cell tumours is obvious. Of these about one-half occur after the menopause and of theca-cell tumours about 86 per cent. No theca-cell tumour has yet been reported in childhood.

267 Utero-placental Apoplexy

According to A. VAN CAUWENBERGHE (*Brux. med.*, January 31, 1937, p. 516) utero-placental apoplexy (accidental haemorrhage) may almost exactly mimic placenta praevia by causing profuse issue of red not black blood during sleep without foregoing trauma towards term. The woody hardness of the uterus which has been regarded as a sign of accidental haemorrhage may be absent especially in the earliest stages. Albuminuria is usually present but increased blood pressure and oedema are often absent. In France and Belgium voices have been recently raised in praise of conservative treatment. Brault has reported twenty-two cases of which four were very severe without a death after treatment by rupture of the membranes and Frulinsholz had three deaths only in forty-eight cases treated obstetrically. To van Cauwenbergh, however, in serious cases surgical intervention seems preferable and indeed indispensable when the os is not dilated. Only by abdominal operation can an exact idea be gained of the condition of the uterus. Neither the presence which is constant of free blood stained fluid in the abdomen nor a violent congestion of the uterus necessarily calls for hysterectomy. This is indicated when the uterus or neighbouring organs are the site of extravasations of blood when the uterus after being emptied does not contract well on stimulation or when signs of intense intoxication are present. Foetal survival is very exceptional but occurred in a case here described after Caesarean section done an hour and a half after the first symptom. The writer mentions seven cases of abdominal operation with no maternal death and six foetal deaths. Five had hysterectomies performed and two

hormone (prolan) contents in the blood—an average of 23,000 units as compared with 9,000 for normal pregnancy. A primary organic factor may be suggested by an abnormal degree of activity of the plasmoidal elements of the placenta. Their exuberance of the syncytial cells is associated with increased hormone production as shown by the authors' finding that in hydatidiform mole notable increases of urinary and blood hormone may be associated with histological signs of increased activity of the ectodermal plasmodium.

Pathology

269 Weltmann's Serum Coagulation Test

R. TEUFEL (*Med. Klinik*, February 12, 1937, p. 237) has simplified Weltmann's serum coagulation test and overcome its disadvantages—namely, the length of time taken (25 minutes), the large quantity of blood required to give 1 l.c.m. serum and the large amount of electrolytic solution needed. A test tube made of special glass with a bulb 8 cm. from the end (to prevent the expulsion of boiling fluid) is used. 0.1 c.m. non-haemolytic serum free of blood corpuscles in 4.9 c.m. of distilled water is introduced into the test tube. Then two drops of the electrolytic solution (0.5 per cent crystalline CaCl₂) are put into the tube held vertically. Each drop must contain exactly 0.05 c.m. of the electrolytic solution. The solution is boiled and then held to the light for examination of flocculation. If no coagulation has occurred two more drops are introduced and the solution boiled again. (Care must be taken owing to the great heat of the solution.) The procedure is repeated until flocculation is observed. The test is performed in three minutes. Flocculation with two drops of the electrolytic solution indicates a coagulation value of X. Four drops a coagulation value of IX, etc. The coagulation band is shortened in exudative and necrotic lesions and the nephroses. It is lengthened in lesions involving the hepatic parenchyma and in haemolysis. Abnormal values always indicate a pathological condition as the test is unaffected by pregnancy, menstruation or slight disturbances of health.

270 Aetiology of Influenza

F. WOLTER (*Med. Welt*, February 20, 1937, p. 241) differentiates between endemic and epidemic influenza. The aetiology is, according to him, not quite the same. In the former contact, droplet infection and a multiplicity of organisms can be cited as aetiological factors. Hygienic measures may be adequate prophylaxis in individual cases but they will not prevent pandemics or epidemics. The theory that influenza spreads along trade routes by contact alone can no longer be held in view of the fact that epidemics arise simultaneously in places widely separated from one another and that the severity of the epidemic varies in different places. In epidemics telluric and meteorological factors play the leading aetiological part. It is known that owing to climatic changes the rise and fall of the surface and underground waters affect the humidity of the soil. Various authors have shown that epidemics of influenza occur in places widely separated from one another in which the necessary humidity is to be found and that the peak of the epidemic occurs at the maximum point of humidity. This would account for the seasonal occurrence of influenza for in spring the surface water level is at its highest. It has further been shown that influenza epidemics occur at periods of high atmospheric pressure and some authorities believe that changes in atmospheric pressure over different

Decline and Fall of the Undescended Testis

Lancet p. 999 May 2, 1936. A Report on 25 treated cases

GROUP	TYPE	CASES	RESULT
I Adherent Normal Testis Normal Child	Unilateral -	5	Failed
II Subnormal Testis Subnormal Child	{ Bilateral Bilateral & hypo- spadias - Unilateral	{ 6 2 3	Cured
III Subnormal Testis Normal Child	{ Unilateral - Bilateral	{ 3 3	Cured Improved

Pro titutioner B67-668 November 1936

Treatment is undertaken in order to safeguard the gland from the trauma to which it is inevitably exposed and also to encourage its development by placing it in the only situation in which maturity can be reached

Intramuscular injections in doses of 500 rat units are given. A large number of successes is obtained especially when the general development of the testis is definitely below normal

THE IDEAL ANTACID

Magnoleum is an emulsion of liquid paraffin and magnesium hydroxide prepared entirely by mechanical means without the aid of any constipating mucilaginous emulsifying agents. Its action is that of its active ingredients in an extremely fine state of subdivision. Being perfectly

miscible with water or milk it may be diluted before taking, given to bottle fed infants in food, etc. It is readily acceptable to children and delicate or fastidious adults. Issued in convenient wide mouthed glass bottles 1/3 and 2/6. Write for specimen for clinical trial

'CELLANBAND'

ANTISEPTIC PASTE IMPREGNATED
BANDAGES

The CELLANBAND Dressing when properly applied furnishes a mechanical support vastly superior to crepe or rubber bandages, elastic hosiery, etc. and will usually be found sufficiently robust to enable the convalescent to resume reasonable light duties at an earlier period. CELLANBAND Dressings exercise a marked dehydrating and antiphlogistic effect resulting in rapid reduction of oedema. Air access to the tissues is not interfered with as in the case of gelatine dressings, so that evaporation of the skin secretions continues normally.

12/- PER DOZ (7 yds long 4 in wide)

This Registered Hospital is now situated at Monks Orchard in some 250 acres of park pleasure and farm grounds. Applications can be considered on behalf of patients of the educated classes in a presumably curable condition.

With a view to early treatment voluntary or uncertified patients are admitted.

Patients who can contribute 5 guineas weekly towards the cost of treatment and maintenance may be received. The Committee will also consider applications for admission at lower rates and in certain cases will be prepared to treat patients free of charge.

Every facility for specialised investigation and treatment is provided in the Lord Wakefield Science and Treatment Unit. In this unit is found X Ray and Dental Departments and the Bio-Chemical Pathological and Psychological Laboratories.

Furthermore provision is made for Electro-Therapy and Hydro-Therapy to be carried out in all their forms and Occupational Therapy under competent instruction is encouraged.

In addition to the Resident Medical Staff Consultants in special branches of medicine and surgery are available wherever required.

The comfort of sensitive patients is greatly enhanced by the fact that the majority are given single bedrooms.

For forms and further particulars apply to the Physician Superintendent at the Hospital.

NEW LODGE CLINIC, WINDSOR FOREST

March 27th 1937

AMENDED ADVERTISEMENT

COUNTY COUNCIL OF ESSEX AND URBAN DISTRICT COUNCIL OF THURROCK.

Appointment of Lady Assistant County Medical Officer and Assistant Medical Officer of Health.

Applications are invited for the undermentioned appointments—

	Commencing Salary Per annum
Assistant County Medical Officer	£200
Assistant Medical Officer of Health for the Urban District of Thurrock	£300
	£500

Applicants who should not be over 45 years of age must be duly qualified Medical Practitioners with special experience in Obstetrics and hold a Diploma in Public Health.

The person appointed will be required to pass a medical examination and to contribute to the funds established by each authority under the Local Government and Other Officers Superannuation Act 1922.

The total salary of the person appointed will be subject to satisfactory service by annual increments of £25 to £700 per annum. If the person appointed undertakes on behalf of the Urban District Council of Thurrock attendance at a Women's Welfare Clinic an additional £12 per annum will be payable to her by the District Council. A travelling allowance of £15 per annum is payable by the Urban District Council of Thurrock.

The appointment to the Office of Assistant County Medical Officer will be subject to the Sick Pay Rules and Regulations of the County Council, a copy of which will be forwarded on request. Applications on the prescribed form (obtainable from the undersigned) should be delivered at the County Hall, Chelmsford not later than Monday April 19th 1937.

Apr. 2nd 1937

ROYAL CORNWALL INFIRMARY, TRURO.

HOUSE SURGEON (Male) The Royal Cornwall Infirmary, Truro, is seeking a qualified and experienced House Surgeon to take up duties on May 1st next. Salary £120 per annum, board and lodging, and a motor car. Applications should be sent to the undersigned on or before April 15th 1937.

W. L. CORNFIELD, Secretary.

BOROUGH OF MORLEY.

APPOINTMENT OF ASSISTANT MEDICAL OFFICER OF HEALTH AND ASSISTANT SCHOOL MEDICAL OFFICER.

Applications are invited from registered medical practitioners (male or female) for the above-named post. It is desirable that applicants should hold a Diploma in Public Health.

Applicants should have had at least three years experience in the practice of their own profession and have had special experience in Maternity Child and Infant Welfare work and in the administration of Dental and other Anaesthetics.

The person appointed will be required to work under the direction of the Medical Officer of Health and School Medical Officer and to devote the whole of his or her time to the duties of the office which will consist chiefly of School Medical Maternity and Child Welfare work together with such other duties in the Public Health Department as may be required.

The appointment will be a designated post under the Local Government and Other Officers Superannuation Act 1922 and the successful candidate will be required to pass a medical examination.

Salary will be at the rate of £300 per annum rising subject to satisfactory service by annual increments of £25 to £700 per annum. The appointment will be determinable by one month's notice on either side.

Forms of application may be obtained from the undersigned to whom they should be returned completed in a sealed envelope endorsed Assistant Medical Officer together with copies of three recent testimonials on or before April 21st 1937.

E. V. FINNIGAN Town Clerk.
Town Hall
Morley
March 25th 1937

THE BRITISH PHOSPHATE COMMISSIONERS
BUSH HOUSE ALDWYCH
LONDON W.C.2.

Applications are invited from unmarried gentlemen for the post of ASSISTANT MEDICAL OFFICER at Ocean Island, Gilbert and Ellice Island Colony, Central Pacific. Candidates should be under thirty years of age and possess a British degree or diploma in medicine and surgery. It is very desirable that applicants have held general hospital appointments since qualification.

The climate of Ocean Island is very healthy. There is a fully equipped hospital and operating theatre. Salary is at the rate of £500 p.a. Australian currency with free board and lodging. The appointment is for a period of four years and is renewable. First-class ocean passages will be provided to and from the islands.

On completion of 2 years service at the Island 2 months leave on full pay is allowed in Australia or New Zealand. If after 4 years service the employee is re-engaged for a further four years he is allowed 3 months holiday on full pay in England. Applications with copies of three recent testimonials should be submitted not later than Wednesday April 7th 1937 to the London Manager British Phosphate Commissioners from whom full particulars of the appointment may be obtained.

REVISED TERMS ON APPLICATION

One of many examples of completely new X-ray equipment from the Watson range

WATSON'S "VERSATIL" and the "SUNIC ROENTGEN POWER UNIT"

For the hospital of medium size, this combination has proved itself the most successful type of installation within recent years

It is capable of producing excellent results in every class of radiography, is fully shockproof, extremely reliable, occupies little space, and involves the minimum of installation costs

The rapidly increasing list of users includes — Norwood and District Hospital, Cromer and District Hospital, East Ham County Council Hospital for Epilepsy, London Fernbrae Nursing Home, Lancashire County Council Hollywood Hall Sanatorium, Beckenham Cottage Hospital, Providence Free Hospital, St Helens and Park Prewell Mental Hospital

THE "VERSATIL"

A combined couch and screening stand designed on entirely new lines and remarkable chiefly for the ease with which it is manipulated. Suitable for under and over couch work, vertical screening, radiography and tele radiography. British made.

Please ask for literature describing modern X-ray equipment for all requirements

THE "SUNIC ROENTGEN POWER UNIT"

A highly efficient 'X-ray generator' comprising shockproof tube, transformer and control table. Has superseded the single valve set. Incorporates many refinements such as automatic tube loading, valve timer, automatic change-over from screening to radiography etc. (Philips Metalix Patent.)

TREATMENT—PREOPERATIVE AND POSTOPERATIVE

By **ROBERT L. MASON, A.B., M.D., F.A.C.S.**,

*Assistant in Surgery at the Massachusetts General Hospital
Octavo of 495 pages, illustrated Cloth, 25s net*

This new book meets a very definite demand that has existed for a long time—a demand for a book that would present preoperative and postoperative treatment as it is being practised *to-day*.

Dr. Mason and his associates at the Massachusetts General Hospital have kept in mind two outstanding factors in *preparing* the patient for operation and in *caring* for the patient *after* operation:

- 1 The frequency with which the general physician is called upon to prepare the patient for the operation and to care for him after the operation has been completed and the patient discharged from the hospital
- 2 The fact that operation to-day is concerned not only with removal of diseased structure but equally so with the *restoration of normal function*

With these two cornerstones Dr. Mason has built a work that we firmly believe is far and away the best on the subject. It is practical from beginning to end. It is definite. It is a record of experience gained with a vast wealth of clinical material at one of the famous hospitals of the world. It is detailed. It even includes instructions on Nursing Care.

83½% of British Doctors
prefer a mild cigarette!*

"Doctors are right in preferring a mild cigarette. They say I'm a lucky actress—always in long runs. Well there'd be an understudy in long runs if I didn't take care of my throat. It's always Kensitas for me—I know their mildness will never affect my throat."

Fay Compton

MISS FAY COMPTON the famous stage and screen star

In a recent independent survey, an overwhelming majority of lawyers, doctors, lecturers, scientists, etc., who said they smoked cigarettes, expressed their personal preference for a mild cigarette.

Miss Compton verifies the wisdom of this preference and so do other leading artists of radio, stage, screen and opera, whose voices are their fortunes, and who choose KENSITAS, a mild cigarette. You, too, can have the throat protection of KENSITAS—a mild cigarette free of certain harsh irritants removed by the exclusive KENSITAS Private Process.

* 83½% of British doctors, who smoke cigarettes, as shown by replies to a strictly independent survey, prefer a mild cigarette.

Kensitas—the MILD cigarette
"Just what the Doctor ordered"

Left Figure A Spencer Supporting Corset shown open revealing inner belt and its tapes for separate adjustment. Note that the pull of the abdominal support is placed on the pelvic girdle.

Right Figure Spencer Supporting Corset shown closed. Note that the tapes of the inner supporting belt emerge on the outside of the corset and are separately adjustable. By tightening lower tapes a distinct abdominal uplift is provided.

Where these conditions are known to exist and support is needed the Spencer Abdominal Support is an accepted corrective measure. It affords definite relief by supporting the organs as nearly as possible in normal position and in effecting a marked posture improvement.

Because each Spencer is individually designed and made from the actual measurements and posture description of the patient exact fit and perfect comfort are assured and it will not ride up or slip out of place.

Spencer Supports are individually designed for Breast Conditions,

Trained Spencer Corsetiers are resident throughout the kingdom.

Name of nearest gladly supplied on request.

A scientifically trained Spencer Corsetier will call at your surgery or at your patient's home to take measurements under your supervision.

Spencer Support and Corset are never sold in shops.

A Ray of patient with and without Spencer Support for ptosis of stomach. The lower dotted line indicates the pubic articulation, the upper shows the remarkable uplift provided by the Support.

Name Dr

Address

Long Distance, Distortionless, Hearing achieved by Scientifically Approved DEAF AIDS

So many extravagant claims are made for various types of hearing aids that I wish to confine myself to the barest statement of fact. Amplivox Deaf Aids have a frequency range of from 50 to 6000 cycles per second—they are valve amplifiers yet they are no larger than a box camera—they combine high fidelity reproduction with exceptionally long range. All these statements are supported by medical testimony and by testimonials from hundreds of users which you can read for yourself in the Amplivox brochure. Let me send you a copy—I shall be pleased to arrange for any of your patients to have an Amplivox on a week's trial.

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron. The preparation has none of the disadvantages of *Pil Blaud*. The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided.

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated.

Iron Jelloids

Purity Activity Stability INSULIN 'A.B.'

Insulin 'A.B.' was the first British insulin offered commercially to the medical profession. Its manufacture on an industrial scale was the direct result of research carried out by the joint manufacturers in their physiological and chemical laboratories: its supremacy has been fully maintained by the persistent work of the research staff engaged in its production.

Insulin 'A.B.' has a world wide reputation for its strictly safeguarded sterility, its carefully standardised strength, its freedom from toxic reactions and its stability in hot climates.

The digestive properties of **BREAD** are sometimes overlooked

It is well to remember these words of that great authority,
Prof R. H CHITTENDEN, Ph.D., LL.D., D.Sc. of Yale

"A diet of bread leads to the secretion of a smaller volume of gastric juice than a corresponding weight of meat produces, but the juice secreted under the influence of bread is richer in pepsin and acid, i.e., it has a greater digestive action than the juice produced by meat"

There is thus the digestive argument as well as the more usual recommendation of

BREAD for **ENERGY**

C.F.11295

MANDELIX

(Class of Ammonium Mandelate B.D.H.)

Mandelix is a concentrated elixir of ammonium mandelate in a highly palatable form, two fluid drachms of this elixir contain the equivalent of the full therapeutic dose of mandelic acid, its administration is now a standard method of practising mandelic therapy in urinary tract infections

THE INEVITABLE

Even where an operation remains the only cure for haemorrhoids, Anusol brand Haemorrhoidal Suppositories will prove a source of comfort to the patient and a valuable aid to the surgeon.

Sympathetic, anodyne, decongestive, antiseptic, yet free from opiates and local anaesthetics, Anusol Suppositories are safe in any case. They alleviate pain, reduce inflammation and congestion and control bleeding.

After the operation they soothe and protect the mucosa and promote healing. By softening the faecal mass they render evacuation easy and painless.

May we suggest a trial of Anusol Suppositories in one of your present cases? A trial supply sent on request.

'PANOPEPTON'

A Food for the Sick

Which measures up in the present day science and concept in nutrition—established as a resource of especial value by the extensive experience of clinical test

'PANOPEPTON' is the entire substance of beef muscle as brought into hydrolysed solution in contact with gastric mucosa juice. This in combination with the substance of wheat berry as converted into solution by pancreas gland tissue juice

'PANOPEPTON' presents for the nutrition of the sick these basic food materials in the form in which they are set free and elaborated in the normal digestive scheme

'PANOPEPTON' is a food—agreeable—grateful, even to the very sick, requires no preparation

Supplied in 12-oz bottles

ZANT

A Non-poisonous, Non-irritant
Non-staining Germicide
with a Rideal-Walker value
of SIX

ZANT will not damage the skin even at full strength. Used in the recommended dilutions, its solution can be applied to delicate mucous surfaces without discomfort.

ZANT is ideal in Obstetrics and Surgery. It forms very effective Oral, Nasal and Vaginal douches.

ZANT is the result of long investigation by our technicians at Evans' Biological Institute, and owes its high germicidal power mainly to a new method of combining para-chlor-meta-xyleneol.

A step in the right direction

New Cocoa Process means improved nutrition for the masses

THE desirability of increasing the nutritional value of the diet of the masses is too obvious to need emphasis here. Because it achieves this end without adding one penny to the cost of meals, we believe the new predigestion process now used in making Rowntree's Cocoa will be of real interest to every medical man.

This new predigestion process makes for improved nutrition in two ways—

1 The buffering power of Rowntree's Cocoa is increased by 10%—and consequently its role in the digestive process is increased accordingly. It now makes even milk three times as digestible. The increase in digestibility is particularly noticeable with the enzyme crepsin making this im-

proved cocoa particularly beneficial to children. Practically no indigestible protein now passes into the large intestine thus bacterial decomposition and the accumulation of poisonous substances in this region is avoided.

2 The protein in Rowntree's Cocoa is now more digestible than that in other cocoas. This means that it actually builds more bone and muscle than other cocoas—again a factor of particular value in the case of children.

* * *

This improvement in Rowntree's Cocoa has been made without altering the delicious flavour in any way. The price is also unchanged.

ROWNTREE AND COMPANY LIMITED, YORK

Indigestion is often relieved by a change from ordinary astringent tea to the mild and delicious

"Ty-phoo" TEA

Many doctors write us in confirmation

OVALTINE

IN SICKNESS AND CONVALESCENCE

GODDESS
NEITH
Personifica-
tion of fertility
Power which
was not lost
with self-
creation

M 278

THE impairment of digestive powers which is commonly met with in the febrile patient combined with the lack of desire for food often aggravates the difficulty of adequately replacing the increased loss of energy and destruction of tissue which occur

Ovaltine provides a satisfactory solution to the problem of alimentation in many cases of sickness and in the stage of convalescence after severe, prolonged and debilitating illnesses where an easily assimilable palatable and concentrated nutrient is required. It is always acceptable.

Ovaltine replaces with advantage the ordinary milk preparations which so often prove distasteful to the invalid. Prepared from full-cream milk, eggs and malt extract in carefully balanced proportions it provides complete nourishment in the most readily assimilable form.

X-Ray Diagnosis with Iodised Oil

The injection of iodised vegetable oils as a means of conducting explorations of various delicate organs and cavities of the body, for which purpose both barium and bismuth preparations are unsuitable, has now become routine. The method is particularly suitable for use in the examination of the bronchi and the uterus.

In the Addendum 1936 to the *B.P.* 1932 the specification for iodised oil

(*Oleum Iodisatum*) is an iodine addition product of poppy seed oil containing 39 to 41 per cent of combined iodine. It is a pale yellow, viscous, oily liquid, and is opaque to X rays. Iodatol, 40 per cent, the original British made iodised oil, conforms with this specification.

Iodatol, 40 per cent, is available in bottles of 20 c.c. and 50 c.c. from the principal pharmacists.

IODATOL, 40 PER CENT.

QUESTIONS and ANSWERS

Doctors have asked many questions concerning Dole Hawaiian Pineapple Juice since this natural unwatered beverage was introduced to Britain. We are always pleased to answer questions personally, but for your convenience we have listed those asked most frequently.

1 Is it a *hy* product? What do you add to it? Water? Sugar?

It is far from being a *hy* product. The juice is extracted from sun-ripened Dole-grown Hawaiian pineapples. The exclusive Dole Fast Seal Vacuum Packing Process brings it to you fresh, with no added sugar, no preservatives.

2 Where can I buy it?

At nearly all grocers.

3 Is it good for babies?

Yes, it is an item of infant diets in many hospitals. It is easily digested and assimilated. Here is a typical analysis of Dole Pineapple Juice.

Moisture	87.3%
Ash	0.4
Lat (ether extract)	0.3
Iron (N. Co.)	0.3
Crud fibre	0.1
Titratable acidity (citric acid)	0.9
Reducing sugars (in 100 g)	1.1
Carbol. diastase (in 100 g)	0.38

(by difference)

How the Purity of LACTOGEN is Ensured and Safeguarded

In the production of Lactogen, every possible safeguard and precaution is taken to ensure the maintenance of purity at every stage

Only the purest and richest cows' milk, after special tests, is used in the preparation of Lactogen

Right through the process of manufacture, rigid safeguards are taken to ensure freedom from contamination

The finished product, which is untouched by hand throughout, is packed in specially designed airtight containers as a final safeguard

Thus Lactogen, which in proportions and in physical characteristics so closely resembles breast milk, is also the safest food that it is possible to obtain

TRUFOOD BABIES BECOME STURDY CHILDREN

The theory behind Humanised Trufood is the simple one that the mother's milk is the best food for an infant and that any substitute infant food should resemble human milk as closely as possible. Analysis of Humanised Trufood shows it to be virtually identical with human milk. The sturdiness of children who have been fed on Humanised Trufood, and their absence of digestive troubles in infancy, is convincing evidence of the soundness of this theory.

SUCCESSFUL BREAST FEEDING DEPENDS ON PRE-NATAL DIET . . .

During the pre-natal period Robinson's 'Patent' Groats and milk provides an adequate supply of calcium so essential to expectant mothers. Prescribed for nursing mothers, it promotes a free secretion and adds materially to the nutritive value of the breast milk. And both before and after the baby is born Robinson's 'Patent' Groats and milk builds and sustains a mother's strength and generally assists the digestive system.

for Nursing Mothers prescribe

ROBINSON'S "PATENT" GROATS

Robinson's 'Patent' Groats is packed in sealed hygienic tins and is quickly and economically prepared in a variety of ways. Descriptive pamphlet and clinical trial sample will gladly be sent on application to KEEN ROBINSON & CO. LTD., Dept. V-190, Carrow Works, Norwich.

Elastoplast and Post-Operative Dressings (Abdominal)

Elastoplast has proved itself to be invaluable when used in conjunction with the usual sterile dressing. It facilitates inspection and it is a simple matter to change the dressing by following one of the methods in daily use which are described in 'Elastoplast Technique'.

"As soon as an abdominal wound is healed I allow

the patient to go home with pain over the wound and this is kept on by transparent pieces of Elastoplast and no bandage.

I R C S

"For retention of dressings after operation the Elastoplast prevents slipping of dressings and provides a firm pressure for the wound, thus preventing operative collection of blood or serum underneath."

M S, I R C S

A copy of "Elastoplast Technique" will be sent on request.

BALANCED ALKALINE MEDICATION

THE WIDER FIELD OF APPLICATION

THERE are many conditions which are sequelæ of or accompaniment to diseases in which the administration of alkalis is of definite benefit

Hyperchlorhydria, hyperacidity, nervous dyspepsia, together with acidoses and ulcers of the stomach and duodenum have always been considered as conditions for which alkali medication is indicated, but there are also pathological manifestations far removed from these conditions which have been found to respond to proper alkaline medication

Clinical experience has shown that the alkalis chosen in BiSoDoL viz sodium bicarbonate and magnesium carbonate, are therapeutically an ideal combination. The sodium bicarbonate offers the system a readily available alkali and the insoluble basic carbonate provides pronounced alkalinizing powers against acidity as it arises. The mixture presents a combination of unusual buffering agents and avoids therefore the possible danger of alkalosis, which is associated with the administration of a single alkali.

The depletion of the alkali reserve and the consequent disturbance of the acid base balance of the body, caused by disease, can therefore be compensated for by the careful use of BiSoDoL.

While the formula of 'BiSoDoL' was originally evolved for the correction of acid conditions of the stomach, so suitable has it been found in balanced alkaline medication, that it is now largely prescribed in this wider field.

SKIN THERAPY

Medisoaps

(MIDGLEY)

Made to 49 separate formulae

The purpose of the "Medisoap" series of medicated soaps is to enable physicians to prescribe, in a pure saponaceous basis, the medicaments indicated in any particular case of skin disease

The formulae embrace the majority of the recognised medicaments which can be used effectively in this way. Each "Medisoap" had its origin in the prescriptions of dermatologists and the whole series has been revised from time to time in the light of accumulating medical experience. "Medisoaps" are therefore an important contribution to the therapy of the skin.

Our records show that the application of medicaments in this form is successful in a wide variety of skin diseases and there are well authenticated cases in which the method has succeeded in clearing up conditions which have defied other treatment.

Uncontrolled self-medication with unsuitable applications often causes deep seated damage to the tissues. Excepting in the rare cases when water and soap are contra-indicated, a preliminary course of "Medisoap" treatment will often soothe the irritation and pave the way to a good recovery under medical guidance.

In order to expedite the selection of a "Medisoap" appropriate to any particular skin condition, we publish a Prescribers' Index to Medisoaps, which contains a clinical index and gives the full formulae. A copy of this Index will be posted on request.

NATURAL ACTION

7½^D
Per
Packet

Medical men the world over are turning to Kellogg's ALL-BRAN as an effective and completely harmless constipation remedy. ALL-BRAN is easily digested and retains the valuable properties of the raw bran: assimilable iron and Vitamin B. ALL-BRAN cleanses like a *water-softened sponge*. Within the body the soft "bulk" of ALL-BRAN gently exercises intesti-

nal muscles, and *sponges out* the system of waste matter.

Kellogg's ALL-BRAN is effective in all ordinary cases of constipation except those with hyper-sensitive alimentary tracts. It needs no cooking. Serve like any other cereal food or make into biscuits, cakes, omelettes, etc. Full-sized sample packet free on request.

98% cases of
CONSTIPATION
yield to the BRAN remedy

In laboratory tests, Bran has proved a definite remedy in 98 cases out of 100. The failures were all due to the patients' inability to accommodate bulk in fruit, vegetables or Bran.

Cystopurin

The ideal urinary antiseptic for oral administration!

From information received —

My experiences of Cystopurin have been very happy. In infections of the urinary tract generally the results are excellent. At present I have an old male patient with a chronically infected bladder. He has had trouble for years at times passing thick mucus and blood. He would not be without Cystopurin as since using it his urine has kept fairly clear and his dysuria is markedly better."

Cystopurin has been given to a male patient of 47 years with gonorrhoea proved by bio-copy. I gave three tablets daily at first now twice 5 weeks' continuous irrigation with Pot. Permang., one in 8000. No other treatment, and in 5 weeks no evidence of disease by prostatic massage.

I prescribed Cystopurin in different diseases of the urinary tract, e.g. in gonorrhoea, pyelitis and cystitis with very good results."

"I obtained very encouraging results from Cystopurin in a case of pyelitis of five years' duration. The discharge has greatly decreased and the mild pain of which the patient was complaining entirely subsided after five days' course of treatment."

"I found great advantage in your Cystopurin Tablets in cases of chronic nephritis, diabetes among our men of whom a considerable number suffer from various types of bladder and kidney weaknesses after the age of 40. I attribute it in a lot to the nature of their calling and exposure to chills and wettings."

I have tried Cystopurin in a case of urinary deposit associated with lumbar pain and some degree of chronic cystitis (patient aged 70). Very satisfactory results accrued, the patient being enabled to get about and enjoy his usual hobbies."

B₁ : 400

No one would think of prescribing, for example, insulin of unknown potency or non-standardized Vitamin A or D preparations. Why then prescribe non-standardized Vitamin B₁ preparations? Not only is Bemax standardized at 400 International Units per ounce, but it is also stable over a period of years, i.e., its potency does not deteriorate with age. Such statements cannot be made in respect of any other natural source of Vitamin B.

Providing as it does the unique combination of a natural yet standardized source of Vitamin B₁, Bemax is used as a routine in PREGNANCY, LACTATION, DEBILITATED STATES IN CHILDREN, DIGESTIVE DISTURBANCES and CONSTIPATION. Vitamin B therapy in the form of Wheat Germ (of which Bemax is a stabilized and standardized preparation) is recommended by the Committee of the British Medical Association for FIBROSITIS and ARTHRITIS.

In addition to its high Vitamin assay, Bemax is a unique source of accessory nutritive factors for the optimum protective diet. (See table below)

BEMAX

Vitamin B₁—400 Intern. Units per ounce

Vitamin B₂—Flavins present, 100 (anti-oxidant U) one of the richest sources

Vitamin E—the richest known food source

Phosphorus—133 mg. per ounce

Magnesium—60 mg. per ounce

Iron—3 mg. per ounce (0.4 available iron)

Copper—0.4 mg. per ounce

Fibre—less than 1.0%

E : ?

While a standardized source of Vitamin E does not yet exist, the physician will naturally turn to the richest supply. The most recent activities in research on Vitamin E point to wheat germ oil as the richest source. Now that it has been established that human sterility and habitual abortion, when not due to pathological conditions or anatomical abnormalities, may sometimes be traced to a dietary deficiency of Vitamin E, the use of Fertiol—wheat germ oil—is to be preferred. The Vitamin E activity of Fertiol does not deteriorate with keeping. Administration over a period has no ill-effect. The dose recommended for patients is one to three 5 minims capsules daily for a minimum period of three months.

HEAD INJURIES IN GENERAL PRACTICE *

BY

SIR JOHN FRASER, K C V O, M C, M D, F R C S

Regius Professor of Clinical Surgery University of Edinburgh

In a single surgical charge in the Edinburgh Royal Infirmary over the period of a year seventy cases of head injuries were admitted 55 per cent of the total admissions, and the mortality was 142 per cent. I have quoted these figures to show what is already known—that this type of injury is relatively common increasingly so and that it is associated with a considerable risk to life.

Significance of the History

It is important to have some record of the history of the accident if certain pitfalls of diagnosis are to be avoided for there are many conditions apart from head injury which are associated with unconsciousness. The position is all the more confusing when there are no witnesses of the occurrence the only evidence available being the fact that the individual was found lying unconscious perhaps bleeding from a scalp wound.

Some months ago a woman in the late sixties was admitted to my ward. She was deeply unconscious there was a scalp wound in the right temporal region and a flaccid paralysis of the left arm and leg. She had been found lying at the bottom of a common stair and it was the impression of the nurse who assisted her that she must have fallen and injured her head.

In actual fact she was the victim of apoplexy and in this instance the head injury—if the scalp wound may be described as such—was *post hoc* to her unconsciousness, though we might have been excused if our appreciation of the position had pictured the reverse. There are similar possibilities of error in relation to the unconsciousness of drunkenness the coma of renal failure and diabetes the collapse of syncope and even the intoxication of drugs.

We must remember too that injury to the skull and its contents may arise through indirect violence.

The roof of one of the large halls in Edinburgh was being redecorated and a rope was passed from the upper scaffolding to the floor. A painter descended by it and unfortunately his hands were slippery with oil so that instead of dropping gradually he came down at a run and arrived at the floor of the hall in a sitting position. He apparently had some degree of concussion but the jeers of his fellow workmen brought him to his senses and he walked away.

Forty-eight hours later he was admitted to hospital with cerebral compression. He died and necropsy revealed a fracture at the base of the skull encompassing the foramen

in another of overlooking cranial or cerebral injury because the *modus operandi* has been atypical.

It may be difficult to obtain an accurate account of the sequence of events immediately subsequent to the injury but it is of considerable practical importance. Following a head injury the sequelae may follow one or other of three possibilities. There may be the temporary disturbance of a slight concussion a brief loss of consciousness followed by a rapid return to complete normality or there may be the deep unconsciousness of a severe concussion the state developing in such close relationship with the accident that it appears to arise coincident with the blow or yet again consciousness is retained for some time after the accident but presently there is a lull and a state of stupor develops. The first and second of these possibilities require no elaboration their meaning is apparent but when the third development is recorded it is apt to have a somewhat sinister significance for it may be that it records the historical sequence of a case of cerebral compression. If the individual retains consciousness for an appreciable period of time after the accident and then passes into a stuporous condition the chances are that a lesion was initiated the effects of which are now being manifested.

Shock and Other Injuries

There are three questions which our preliminary examination should attempt to answer:

1. Is shock present and if so to what degree?
2. Are other injuries present apart from damage to the skull and its contents?
3. What type or types of head injury exist?

The first and second of these considerations are incidental matters and yet they have a real importance. Shock is the sequel of severe injuries whatever their character but it is apt to be manifest in head injuries to a disturbing degree. It is the inevitable accompaniment of concussion if the latter is in any way severe and in actual fact there is no clear line of distinction between the two. We recognize the existence of shock and estimate its degree by the appearance of the patient and by the fall in blood pressure and having recognized it we are entitled to draw the conclusion

* This is the chance of a head injury in the general practice.

pressure it affords a temporary safeguard against bleeding immediately after the accident.

We should treat the shock but appreciating that it has a certain salutary influence we should not employ the intensive stimulating methods that are used in ordinary shock, lest by so doing the blood pressure is unduly raised and intracranial bleeding ensues.

Injuries of other parts must be examined in order that their exact nature may be estimated and the urgency of their treatment decided. The injuries of motor accidents are often multiple, and I have known a man sustain a perforation of his intestine in addition to severe injury to the skull. The preliminary examination should review the general situation and allow of a decision on the relative urgency of the individual lesions.

Possible Head Injuries

Estimating the damage which may have been received by the skull and its contents is, however the most important part of the examination. Individually or in any combination there may be the following:

- | | |
|---------------------------------|------------------------|
| 1 A simple scalp wound | 4 Concussion |
| 2 A fracture of the skull vault | 5 Cerebral compression |
| 3 A fracture of the skull base | 6 Cerebral laceration |

The basis upon which this classification is made lacks uniformity—concussion and compression are clinical manifestations, while scalp wounds and fractures are local pathological effects—but I know of no better presentation, and for practical purposes it fulfils our requirements.

When the patient is unconscious we begin the investigation by attempting to estimate the depth of unconsciousness. Such an estimate is a reliable index of the degree of intracranial damage and provides a standard by which we can contrast further improvement or deterioration. Four tests are applied in the following order:

- 1 A simple question such as "What is your name?" spoken in the ordinary tone of voice.
- 2 An imperative question spoken loudly close to the ear.
- 3 The induction of a painful stimulus by pressing the finger nail against the supra-orbital notch.
- 4 Testing the corneal reflex.

I need not elaborate the details beyond saying that response to the first indicates a comparatively slight concussion while failure to react to the last shows the deepest degree of unconsciousness compatible with life—cerebral activity is restricted to the automatic action of the vital centres.

Pulse, Respiration, Temperature, and Blood Pressure

It is in almost universal rule that these observations are recorded at two hourly intervals for the first twenty-four hours and thereafter at four hourly periods. The pulse readings are particularly important. A quickened pulse of small volume is the usual accompaniment of concussion but in the absence of complications there is an early readjustment to the normal. A slowing pulse rate accompanied by an increase in volume is a hint that compression is developing or at least that the vasomotor centres are being stimulated in some way. A quickened pulse rate maintained at high speed and yet showing increased volume is an indication that some degree of cerebral laceration without localized compression exists. These are generalizations but they are sufficiently constant to justify their recognition as indications of certain pathological changes.

Changes in respiration are less common but also of importance. In concussion respiration is usually normal and

shallow. Irregularity of the respiratory rhythm and particularly anything suggestive of a Cheyne Stokes change is ominous, because it is the response of an increased intracranial pressure. A much quickened respiration points to serious cerebral laceration generally of a diffuse character and most medical men are familiar with the respiratory changes of advanced cerebral compression—the irregular stertorous breathing which in its origin indicates an increasing bulbar compression and a failure of the vital nuclei in the medulla.

Temperature readings have a significance which is not fully appreciated. Assuming that extracerebral causes have been excluded, a rising temperature means that some degree of cerebral damage has been sustained. A pure uncomplicated concussion does not exhibit pyrexia, and if the sign is present something more local has occurred—a subdural ecchymosis, a cerebral laceration or a localized compression. I know of few individual features more suggestive than a pyrexial reaction in a head injury, and in general it may be said that the earlier the manifestation and the more intense the reaction the more serious is the cerebral damage.

Blood pressure readings should always be made and the findings recorded at two hourly intervals for twenty-four hours. In the period which immediately succeeds a head injury of any severity the blood pressure falls as recovery advances the pressure rises. If it does so gradually and after rising a few points above the normal readjusts itself to the average figure the prognosis is good and the evidences are those of a simple concussion. But if after the preliminary fall it rises to a high level and is maintained at it, may be 180 to 200 mm Hg there is ground for anxiety for this is a reaction which indicates an increasing intracranial pressure. On the other hand in injuries of extreme severity particularly such as are associated with extensive compound fractures of the skull vault the blood pressure may remain at a low level throughout the entire period of the illness.

Bony Injuries

If a scalp wound is present its position and character are noted and any haemorrhage should be arrested. By gentle retraction of the scalp wound the condition of the underlying skull can be seen and search made for a fracture, remembering always the risk of mistaking an oozing suture for a fissured fracture of the vault.

The skull vault is then palpated methodically, firm pressure being made with the finger tips and any painful reaction is noted. If pain is elicited in the absence of a haematoma it suggests the existence of a fracture. It is possible that the outline of a depressed fracture may be detected but it is difficult to distinguish between a localized circular bone depression and the softened centre of a haematoma. The mouth, the nose and the auditory meatus are examined and if bleeding is encountered an attempt is made to distinguish the haemorrhage of local injury from that which arises from damage to the skull base. If blood is escaping from the external auditory meatus its characters are noted—if its consistency is more watery than normal and if coagulation is delayed the probability is that cerebro-spinal fluid is mixed with it.

The maxillae and the mandible are examined and particular attention is paid to the investigation of the temporomandibular joint. Fractures of the middle of the skull base may result from a blow upon the forehead in such a direction that force is transmitted through the temporomandibular joints and it is well therefore to make this examination a routine procedure.

Pupil Reactions and Tendon Reflexes

Our attention is now directed to the pupils. Two practical considerations are

1 As a general rule the pupils in the average case of head injury are moderately contracted and react sluggishly to light.

2 If one pupil is widely dilated and fails to react to light the other presenting a normal appearance and retaining the light reaction and if the change is noted comparatively suddenly in the progress of the case one or other of two explanations is likely—a pontine oedema or haemorrhage which is interfering with the activity of the third nucleus or a cerebral compression developing on the same side as the dilated pupil. The latter is of significance in the recognition of the compression syndrome.

It is sometimes stated that the fundus oculi should be examined by an ophthalmoscope to determine whether a papilloedema is developing. It is true that in the later stages of compression papilloedema may develop and it is first manifest on the same side as the compression but unless the examiner is trained in ophthalmoscopy he is unlikely to find this method of investigation of practical value.

Examination of the extremities is now proceeded with. Any evidence of twitching is noted and the limb is moved into various attitudes in order to ascertain whether there is flaccidity or spasticity. If there is compression in the cortical motor area changes will be manifest in the musculature of the limbs on the contralateral side at first spasticity and later flaccidity. The tendon plantar and abdominal reflexes are examined but their evidences are not particularly trustworthy in head injuries for they sometimes appear to be disorganized by severe concussion and in the absence of any local cerebral lesion. It is inadvisable to base any definite conclusions upon them in the period which immediately follows a head injury.

An x-ray examination of the skull concludes the preliminary examination. There are circumstances in which such an examination may be impossible but every effort should be made to secure it. It may reveal a vault fracture which has been hitherto unsuspected and by outlining the extent and position of the injury it supplies most important information.

Arriving at a Diagnosis

The practical issue in the diagnosis of a head injury may be summed up in the simple question "Is a state of cerebral compression developing?" The compressing factor may be general as for example a cerebral oedema or it may be restricted and local as in the case of a fragment of bone driven inwards or an extradural haemorrhage and yet again—and this is the most significant possibility of all—it may be local yet progressive so that eventually its effects are manifest throughout the entire cerebral area. A middle meningeal haemorrhage is the classical example of the last possibility and of all the sequelae of the head injuries it is the one which it is most imperative to recognize because in such an eventuality early operation is the only means by which life may be preserved. Compression factors which from the beginning are general in distribution are less urgent questions and there are certain of them which yield to non-operative

pain on pressure but the possibility is put beyond doubt by an x-ray examination—a detail of the investigation which should never be omitted.

Fractures of the Base of Skull—The nature of the injury, the mechanism and the distribution of the force may lead us to suspect a fracture of the base of the skull. Haemorrhage from skull apertures and cavities or a delayed ecchymosis in the subconjunctival or orbital regions may help in diagnosis. Pain produced by firm pressure upon the mastoid processes is a reasonably reliable sign in fractures of the posterior and middle fossae. When other signs are absent the severity of the cerebral damage may indicate the possibility of fracture. A ray examination is rarely helpful—to obtain a reliable picture would necessitate a disturbance of the patient which is not permissible but sometimes the radiograph of the vault reveals a fracture running towards the base and with such evidence we may draw reasonably accurate conclusions.

Concussion

The great majority of head injuries examined within a short time after the accident show evidence of concussion. Compression develops later and the time interval of its appearance depends upon the source responsible. There is some doubt as to the nature of the process by which concussion arises but for our purpose we may accept the view that a sudden trauma applied to the skull is conveyed to the cerebral tissues and thus produces a temporary derangement of nuclear activity and even perhaps a molecular disintegration of the connecting and distributing elements. The result is a depression of the entire mechanism of the central nervous system with the qualification that its effects vary according to the situation and function of nerve elements. As might be anticipated from its exposed position the cortex suffers most and there is a depression of the higher centres which initiate motor and sensory activity with loss of consciousness in varying degrees. So the process is distributed but with this saving element that what might be called the vital nuclei the centres which control circulation and respiration automatic to some extent and resistant at all times are affected least and last.

The clinical appearance resembles that of surgical shock with the addition because of the locale upon which the trauma is exerted of a disturbance of consciousness in varying degree. The state of the patient in the period immediately subsequent to the head injury may be described as follows. He may be unconscious in the first or second degree (a deeper stupor generally means that there is something more than pure concussion), the pulse rate is quickened and of reduced volume, the respirations are quickened and shallow, the blood pressure is reduced and the temperature is subnormal, the musculature is flaccid though occasionally a limb will take up a cataplectic attitude, the appreciation of pain is diminished, the skin is pale and the surface temperature is lowered. This picture represents the state of concussion or, as some prefer to term it, cerebral shock.

Onset of Compression

This accident fecal in its beginnings and yet progressive in character produces a state of affairs which affords perhaps the most illustrative and impressive features of a compression syndrome. When the haemorrhage accumulates to an appreciable extent it constitutes in addition to the already existing volume of intracranial contents and as the intracranial space is already fully occupied accommodation is supplied by displacing a certain amount of cerebrospinal fluid from the cerebral to the spinal distribution. The relief is a limited one, and, the compressing influence continuing to develop, the thin-walled cortical veins become affected. To some extent blood is driven out of them and I suppose an immediate slight further degree of additional accommodation is provided but again the benefit is short-lived and presently the pressure on the veins leads to a congestive reaction throughout the brain substance. Compression continuing and no further accommodation being possible a zone of pressure anaemia appears in the immediate proximity of the compression. In depth the anaemic area is relatively small a matter of millimetres but in surface it will be as extensive as the area in contact with the compressing influence. Anaemia means inactivity of the cortical area concerned the clinical evidence being a localized paralysis of the area innervated from the cortical field. Coincidentally and beyond the zone of anaemia the brain tissue is congested and as venous and sinus pressure continues to be exerted a cerebral oedema develops. Finally if compression continues to be exerted the brain tends to become mobilized towards the skull base in the direction of the foramen magnum.

The significance of the change is obvious. There is medullary compression and oedema gradual failure of the cortical nuclei which control circulation and respiration, and eventually the inevitable result—death from respiratory failure.

Early Symptoms and Signs

The late signs of compression are obvious but under such conditions operation is generally unavailing. Early recognition is essential if good results are to be secured. If there has been a period of consciousness between the concussion and the onset of compression certain symptoms may be recorded. A severe insistent headache is complained of there is an intolerance to bright light amounting almost to a photophobia the mental attitude alters and the patient becomes restless and excitable unduly irritable and even irrational. These are features of much significance and if they are noted in the post-concussion phase they indicate a state of cerebral congestion which may well suggest the onset of compression. Ultimately the patient relapses into unconsciousness and as insensibility deepens the general and focal signs of compression become evident. In such instances the significance of the changes are generally appreciated for the relapse is so impressive that it demands recognition and further investigation.

Dancer arises when the stupor of concussion passes almost imperceptibly into the unconsciousness of compression and the latter state develops so gradually that its recognition is overlooked until the opportunity of affording relief is almost past. In this case the unconsciousness deepens the face becomes flushed there is restlessness particularly when any stimulation is applied to the body surface the pulse is full and volume increased and blood pressure readings are considerably increased the respiratory rate falls but there is a coincident increase in the individual excursions the temperature rises the pupils are equal and contracted the urine is scanty. These

are the evidences of a general intracranial rise in pressure. If the compressing force is focal in its immediate effects certain local peripheral evidences become manifest and these are demonstrated in most characteristic fashion when pressure is exerted upon the cortical motor area a development which arises so typically when the compressing element is a haemorrhage from the middle meningeal artery. As a cortical anaemia develops the musculature of the opposite arm and leg and side of the face demonstrates incoordinated contractions and with further compression a flaccid paralysis is evidenced. Lastly if a unilateral delayed dilatation of the pupil appears it is an evidence of compression on the same side as the dilatation.

These then, are the two aspects of compression the one general both in distribution and in manifestations the other focal in its peripheral effects. It is important to appreciate the distinction and to recognize the actual situation for while the first may be treated in its initial stages at least by non-operative measures the second demands surgical intervention at the earliest moment.

Diagnostic Tripod

Some further evidence is required however and we obtain it by lumbar puncture and the readings of a spinal manometer. The normal cerebrospinal fluid pressure varies within considerable limits 60 to 120 mm of water being regarded as average readings. Where compression exists the readings are consistently higher than 120 mm and they may even reach a height of 250 mm. This is indisputable evidence, and it has the further advantage that it affords a reasonably accurate conception of the degree of the compression. Even if a special manometer is not available lumbar puncture should still be undertaken. A normal cerebrospinal pressure is revealed when fluid drops from the needle at the rate of one drop per second, and one can draw reasonably accurate conclusions according to the variations which are manifest. Lumbar puncture is a valuable procedure but I suggest that it should not be practised until we have reason to suspect that compression may be appearing. To adopt it as a routine in the early stages of head injury is probably injudicious. Its evidence at this stage is not reliable whilst it may be that the manoeuvre so disturbs the pressure balance that a further cranial haemorrhage is started.

To sum up the position we are justified in diagnosing compression on three points of evidence:

- 1 The effect of a general increase of intracranial pressure as revealed by the pulse the blood pressure the respiratory rate the temperature the appearance and general behaviour of the patient.

- 2 The effects of a local cortical pressure as shown by a developing peripheral paralysis.

- 3 The reading of the cerebrospinal fluid pressure.

These are observations which can be made by any medical man and in general it may be said that they are the foundation upon which the diagnosis of compression is based.

Positive Late Developments

If the concussion period has passed and compression has not developed so that no signs appear to be present a natural and satisfactory course here can only be the possibility which have to be kept in mind—delayed compression oedema which arises in association with cerebral laceration and a meningeal cephalitis—both of septic invasion extending from a fracture of the skull has communicated with the meninges and the

The first of these possibilities—compression oedema, a sequel to cerebral laceration—is not unduly serious, but unless we are aware of the possibility we are apt to exaggerate the significance of its development. It generally appears about the fourth or fifth day after the accident, and it is this delayed development which is apt to prove disconcerting. When all appears to be going well, and pulse and temperature have been following normal lines the temperature rises, the pulse rate falls and a drowsiness which may pass into complete unconsciousness affects the patient. It is a temporary change. It usually disappears spontaneously, and its progress can be arrested by one or other of the hypertonic medications which are described under treatment. The origin of the change is not fully understood, but in point of time it appears to correspond to the phase when the reactionary changes preparatory to healing of the cerebral tear are developing.

The second possibility—the development of a delayed infection—is an entirely different matter.

Last November a young man was admitted to my wards with a fracture of the middle fossa of the skull bleeding from the left auditory meatus indicated that the fracture communicated with the inner and middle ears. His immediate recovery was all that could be desired and sixteen days after the accident was sustained I demonstrated the case to a clinic as an illustration of a satisfactory and encouraging recovery. I alluded to the risks of delayed infection but I felt satisfied that in this instance at least the risks were past.

I had spoken too soon the same evening the temperature rose to 99.5 F and the pulse rate had quickened from 80 to 110. When I saw him next morning it was evident that meningitis had developed and in spite of our efforts he succumbed four days later to a streptococcal meningitis.

It was an experience which impressed us with the uncertainty which must attend the later progress of certain types of head injury.

Treatment of Uncomplicated Concussion

The injured man is undressed with the minimum of disturbance. He is placed in bed flat on his back, and his head is turned to one side. In this position he breathes more easily, if he vomits he is less likely to aspirate the vomited matter and if there is bleeding into the mouth the fluid which otherwise would be swallowed will collect in the hollow of the cheek. We assume that the preliminary examination is completed and we have arrived at a provisional appreciation of the condition. At this early stage we may take it that the clinical state is one of concussion the possibility of compression is in the future early or remote as its genesis may decide but at this point it need not trouble us so far as treatment is concerned. Concussion is tantamount to shock and we treat it accordingly. The body temperature is raised by hot water bottles or by a shock cradle. Fluids are administered preferably by mouth or if that is impossible by subcutaneous or rectal routes. Intravenous methods are inadvisable, for a sudden rise in blood pressure may initiate bleeding, and a too copious supply of normal saline may increase the tendency to oedema of the cerebral tissue. In a desperate case it might be permissible to administer intravenous saline by the drip method but the indications are infrequent. If a scalp wound exists we take immediate steps to arrest the bleeding. I suspect that there are many head injuries in which the haemorrhage from a neglected scalp wound has been the factor that precipitated a fatal issue. A two-hourly pulse, temperature and respiration chart is recorded and we keep a close watch upon the state of the bladder. A distended bladder is often the cause of a restlessness on the part of the patient which the physician may ascribe to other more serious influences.

Allaying Restlessness

The patient should be kept as quiet as possible if he is in a hospital ward he is screened off if he is in a room by himself the room is darkened. He may become restless many cases of head injury pass through this phase, and it may be an ominous sign. It may indicate the onset of compression, but in most cases it represents the reaction that is coincident with recovery from concussion. Restlessness presents the first problem in treatment and means must be taken to allay it, for if it persists it is harmful. Any attempt at physical restraint is resented and in the effort intracranial pressure rises at a time when this is least desirable. Morphine and its derivatives are contraindicated for several reasons. They are apt to increase the venous engorgement of the cerebral tissue, they depress the respiratory centre and there is the clinical objection that the resultant hypnosis may disguise the deepening unconsciousness which otherwise would indicate the onset of compression. Experience has shown that chloral hydrate combined with potassium bromide is both efficient and safe. Fifteen to twenty grains of each drug is a suitable amount and if necessary it may be repeated four-hourly. If the patient cannot or will not swallow, paraldehyde may be administered per rectum, it is given in a dosage ratio of 1 drachm per stone of body weight up to a total of eight drachms. In its administration there is the practical point that it is best tolerated when made up in mucilage of acacia in a proportion of two parts to one of the mucilage. There are instances in which these sedatives are insufficient, and in such an event hyoscine hydrobromide in doses of 1/200 grain hypodermically may be given, but only when less powerful sedatives have failed.

Such is the treatment adopted in the presence of an uncomplicated concussion, and in general it may be said that it is the treatment of choice in the early stages of the majority of head injuries.

Treatment of Fractures

Assume now that an x-ray examination of the skull has been carried out, and it is reported that there is a linear fracture of the skull vault. How does this affect the situation? Generally speaking the finding has no particular significance. It is a complicating feature, and implies some increase in the length of time of the convalescence, and when it is shown to occupy a situation which brings it into relation with the middle meningeal artery it may arouse in our minds the suspicion of haemorrhage from that vessel. These are special considerations however, and individual attention is paid to them, but it is well to appreciate that the ordinary linear vault fracture is a relatively insignificant lesion which certainly calls for no variation from the ordinary scheme of treatment.

It may be that the vault fracture is of the depressed variety. In this event are we still to adopt a conservative attitude? The answer is that under certain conditions operation is indicated as when a scalp wound overlies the fracture, when there is radiological and clinical evidence that the fragment is in driven and when we have reason to suspect that the fracture is associated with a subdural or extradural haemorrhage. I do not mean to imply that all of these developments demand immediate operation. The last may be an urgent matter the first has underlying it the anxiety to prevent intracranial infection, and therefore the sooner it is remedied the better. The decision regarding the in-driven fragment will depend on local circumstances, recognizing of course that the

earlier the relief the better for the patient. There is no hard and fast rule, but whenever possible operation should be postponed until the effects of cerebral shock have subsided.

Fracture involving the skull base I dread more than any other type of head injury, for the complications which follow in its wake. Fractures of the anterior fossa of the skull are rarely associated with immediate danger, but they are the type in which a delayed sepsis is apt to arise because of the frequency with which they communicate with the cavity of the nose. Fractures of the middle fossa have dangers which are both immediate and remote—immediate because an extensive haemorrhage so often accompanies the break and because the line of it may involve the sella turcica and endanger the pituitary or its stalk, remote because a communication with the ear cavity may provide the avenue for infection. Fractures of the posterior fossa give us the most immediate concern because of their proximity to the vital area of the medulla, but on the other hand they are in large measure free from the risks of secondary infection.

Taken as a group the gravity of base fractures in contrast to fractures of the vault depends in large measure upon an anatomical fact—the relation of the dura to the bone. At the skull base the dura is closely adherent to the bone so that when a fracture occurs a tear of the dura is almost inevitable. In the vault, on the other hand, dura separates with the greatest of ease except where sinuses exist and the complication of dural rupture is therefore much less frequent. For the moment the knowledge that a fractured base exists need not call for any variation in treatment: we follow the lines which have been described and we take particular care to avoid any obvious sepsis in those cavities which lie in relation to the skull base. It is for this reason that we advise the instillation of a few drops of 5 per cent argyrol into the auditory meatus and perhaps spray the nose and mouth with the same preparation. Restlessness is evident in many cases of this type and if it appears should be treated at an early stage by the judicious exhibition of sedatives.

Treatment of Compression

Twenty-four hours having passed deepening unconsciousness, alterations in pulse, blood pressure, and respiration and a rising temperature may indicate the onset of a generalized and progressive cerebral oedema. A lumbar puncture is carried out and the cerebrospinal fluid pressure is estimated. If the reading is less than 200 mm. of water but above the normal reading of 100 to 120 mm. the cerebrospinal fluid should be drained until a normal pressure is reached; if on the other hand the pressure exceeds 200 mm. it is an indication for more active dehydration by the hypertonic therapy first suggested by Weed and his co-workers. If the patient is able to swallow he is given 2 drachms of magnesium sulphate dissolved in 2 ounces of water and thereafter at intervals of two hours 1 drachm of the salt in 2 ounces of water administered until a watery stool is evacuated. If swallowing is impossible 3 ounces of magnesium sulphate in 6 ounces of water is given in six doses. These are hypertonic solutions and in virtue of their osmotic properties they attract and withdraw fluid from the tissues until an osmotic balance is reached. The cerebral tissue parts with the fluid in common with other tissues and the oedema is thereby relieved. It is an efficient procedure, comparatively painless, but it is proved that it does not balance and it is not a substitute for craniotomy when indicated.

Hypertonic solutions such as 50 per cent glucose or 30 per cent sodium chloride injected intravenously are powerful dehydrating agents. There must be no evidence of recent bleeding if they are to be employed for as rapid dehydration occurs a clot may be disturbed and a serious haemorrhage ensue.

Decision to Operate

If lumbar puncture or alimentary dehydration afford relief the situation may be stabilized and symptoms of compression may not recur. If they do reappear and continue to develop a repetition of the treatment described may be called for. But if all efforts are unavailing and the compression persists and increases I think we are justified in deducing that whatever the cause of the compression it is not a simple and general oedema. It is more likely to be a haemorrhage which is slowly but insidiously progressive and we are now faced with deciding whether or not to operate.

Three general considerations are: first the operation of a simple cerebral decompression is a relatively easy one; secondly if there is doubt it is better to operate than to delay and to regret; thirdly if operation is to be attempted the earlier it is carried out the better. It is my impression that this means of relief is not employed as often as it might be. Too often it is delayed unduly and if so we cannot expect that a local decompression will afford relief to a brain that is completely waterlogged.

TECHNIQUE OF OPERATION

If the patient is deeply unconscious no anaesthetic will be required, but there are many advantages in a local anaesthetic such as 1 per cent novocain to which adrenaline (1 in 200,000 of the solution) has been added. The infiltration is carried along a line which extends vertically upwards from the zygoma one inch in front of the external auditory meatus for a distance of three to four inches.

The superficial tissues are divided, the temporal fascia is incised and the fibres of the temporal muscle are split and retracted so as to expose the bone of the temporal table. The bone is perforated with a trephine or burr at a point about two fingerbreadths above the upper border of the zygoma and with a nibbling forceps the vault is cut away until an aperture about two and a half inches square is made. It may be that the compressing factor is found to be a haemorrhage in the extradural area, the result of a tear of the middle meningeal artery; if so we remove the clot and ligature the vessel. Failing this finding we open the dura in a cruciate manner taking care to avoid the dural vein and if of necessity they must be divided picking them up with a fine round needle and suture and ligaturing each individually.

This is as much as the average operator should undertake. Any obvious source of haemorrhage should be controlled but no further intervention should be carried out unless the operator has special training in neurosurgical surgery. The operation has achieved what was intended—it has relieved intracranial pressure and any haemorrhage encountered has been arrested. The dural flap is left widely separated, the split in the temporal muscle is retracted by a few interrupted catgut sutures, the line of the temporal fascial incision is closed with a continuous catgut suture and the head is covered with a sterile gauze pad or plaster.

Such are the steps of the operation and it will be seen that it is a relatively easy and straightforward procedure. I anticipate that it will be criticized for a number of reasons. A craniotomy should be performed on the whole by a specialist trained in general or neurosurgical surgery. I appreciate all these criticisms but the condition in which the operation is performed is of more importance than the person who performs it. It is a procedure which should be carried out in the emergency department of a general hospital with the necessary facilities and staff.

carrying through a procedure which may be the only means by which life can be saved

In many instances the subtemporal decompression affords relief if it fails to do so and if there is no response to a repetition of the alimentary dehydration we may consider the advisability of repeating a subtemporal decompression on the opposite side, and if this fails we can but await events, with the satisfaction, however of knowing that we have done all that it is in our power to avert disaster

After-treatment

The after treatment of head injuries may be summed up in the words 'Go slow'. Lasting harm may be done by an attempt to shorten the convalescence or to agree to an unduly early return to the stress of everyday life. The period of confinement to bed will depend upon the nature and extent of the injury. Three to four weeks is a common average. A low diet with abundance of fluid is allowed and half an ounce of magnesium sulphate each morning is a safe and efficient purgative. It is a good rule to give 10 grains of potassium bromide daily. It lessens the irritability of the central nervous system and its employment at this early stage may prevent unpleasant sequelae in the future. For insomnia we use luminal (2 grains) or medinal (7½ grains) or soneryl (5 grains).

Sooner or later there comes a time when the question of resuming ordinary activity has to be considered. This is an anxious decision and if we are to do the best for the patient it will be made the subject of experiment. A testing time when a graduated and provisional resumption of activity is permitted will be instituted. If there are sequelae in the form of giddiness and headache, mental fatigue, and inability to concentrate, we must recognize these as warnings that the time is not yet opportune and the patient must be advised to extend his convalescence. This the aftermath of head injuries is in some respects the most difficult problem of all but it is scarcely within our sphere for the moment and I have mentioned it for one purpose only—that our consideration of the subject may be rounded off and reasonably complete.

W. Titkemeyer (*Med Welt* February 13 1937 p 209) draws attention to recent investigations on tobacco smoke which consists of tars, nicotine, pyridine bases, the lower aliphatic acids, carbon monoxide, carbon dioxide, and ammonia. Nicotine is still believed to be its most poisonous constituent. Four drops are lethal in one half to one minute, 40 mg produce disturbances lasting twenty-four hours. Five ordinary cigarettes contain a lethal amount of nicotine. The amount of nicotine absorbed by the body depends on many factors. It is detoxicated in the liver and excreted through the skin and kidneys. The gaseous contents of tobacco smoke are now said to have no effect on the general health. Its deleterious effect on the buccal mucous membrane is believed to be due partly to the raising of mouth temperature, especially in cigar and pipe smokers, and its property of getting saturated with water from the mucous membrane. These factors are more important than the chemical constituents of tobacco in the production of smokers' catarrh. In surveying the literature the author is struck with the discrepancies in the findings of various authors and he suggests in the interests of public health that a more scientific standardization in the investigation of tobacco smoke be adopted—namely, that the length to which a cigarette is smoked be indicated, that the humidity of the tobacco be noted, that the amount of tobacco smoked per cigarette or cigar be weighed, and that the length of the interval of smoking be accurately timed.

INSULIN SHOCK TREATMENT OF SCHIZOPHRENIA

BY

E. H. LARKIN, M.B., B.S. Sydney

*Assistant Medical Officer West Ham Mental Hospital
Clinical Assistant to Neurological Department
Metropolitan Hospital Formerly R.M.O.
West End Hospital for Nervous Diseases*

The insulin shock treatment of schizophrenia is well established on the Continent; the results as summarized in Dr. Isabel Wilson's report for the Board of Control must be regarded as sufficiently encouraging to warrant a trial of the method in this country. The treatment has therefore been instituted at the West Ham Mental Hospital and the results in an admittedly limited number of cases are fully justifying what was initially regarded as in the nature of an experiment. In the preliminary consideration of this treatment the question first to be settled was how far it would be practicable, in view of the complicated technique within the organization of an ordinary rate-aided mental hospital. It is the purpose of the present communication to show that with a well-disciplined and enthusiastic staff it can be undertaken in the infirmary ward of such a hospital without overtaxing the staff and without any serious interference with ward routine.

Administrative Arrangements

It was decided to use the male infirmary ward which serves the whole of the male side (593 patients). In this ward there is accommodation for fifty-three patients. In the observation section there are nineteen beds and two single rooms and a padded room are available. Projecting from this section is a bay of six beds; this was selected for the cases under treatment with a view to disturbing other patients as little as possible. The male nurses work a forty-eight hour week in two shifts of four nurses each. Each shift comprises a charge nurse, a deputy, and two probationer nurses. The shifts work week about mornings and afternoons.

Realizing the need for perfect staff co-operation, the two charge nurses had the treatment fully explained to them. The difficulties and dangers were stressed but good care was taken to reassure them and to work up their enthusiasm. They were then given the Board of Control's Blue Book to read. Incidentally it may be mentioned that the doctor responsible had had experience of hypoglycaemic states whilst working under W. Wilson Ingram (Sydney) during his researches into the massive dose insulin treatment of diabetes mellitus.

Treatment was begun on one patient, a case of severe catatonic dementia praecox. The whole course was carried through on this patient, no further cases being begun until the treatment had been finished, so that the nurses' interest was not divided. They thus became wholly familiar with the routine and gained confidence. It took a fortnight to work up to the shock dose (140 units). During each of the two weeks the afternoon shift, which was not actually doing the treatment that week, was repeatedly put through the drill (described later).

It was found useful for the doctor to pretend to be the patient and to act as dramatically as possible the various crises that might be expected. By the end of the fortnight both shifts were perfect in their parts. The value of this training has since been demonstrated by the fact that no emergencies have occurred during the treatments, which the nurses have not been able to deal with pending the doctor's arrival. Although a patient's appearance has

often been very alarming they have never cried wolf nor on the other hand have they ever failed to notify immediately any critical occurrence

The first patient made an apparently complete recovery from his psychosis the enthusiasm of the staff was therefore well maintained Two patients were then treated concurrently and we now have six beds occupied by patients undergoing active treatment We have had no accidents Altogether 205 shocks have been induced There have been no administrative difficulties and none are now expected One walks into the ward and sees perhaps five patients deep in coma gravely shocked and finds at the same time the other business of the ward being normally carried on

General Results

All the patients treated have been advanced cases with marked immediately discernible symptoms of dementia praecox Five have completed treatment Three have apparently recovered, one with great insight, since discharged The other two are still being watched their insight being developed by daily talks with a view to their adapting themselves well to life when they shall have returned to the outside world

Of the two who have not recovered one is greatly improved and the other is unchanged All except the one failure put on weight while actually under treatment A sixth is nearing the end of his treatment He is improving and has already lost his delusions and hallucinations, after an unremitting attack lasting eighteen months

The Treatment

A typical shock proceeds as follows

About two hours after a shock dose of insulin a change is observed in the patient He sweats profusely and becomes drowsy The pulse rate alters it may accelerate or retard Within about half an hour he becomes restless tossing from side to side at first moaning and later crying out

Then particularly in the first few days furor may set in He leaps up in bed staring and crying out aloud He throws himself about violently and has the appearance of maniacally resisting a great fear He froths at the mouth and his pupils dilate He may beat his head and hands and feet frantically This phase may last for fifteen minutes

Coma follows and the patient lies shrunken into his bed profoundly collapsed with a diminished pulse he is stertorous and ashy pale and is bathed in a profuse sweat Although the pupil still reacts to light the abdominal reflexes are lost and the plantar reflexes are extensor He salivates profusely and must be laid on his side to allow the saliva to run out From time to time he may be convulsed Occasionally a true epileptic fit may be seen with epileptic cry, a tonic stage with cyanosis and a clonic stage

After about an hour and a half he is given glucose solution through a nasal tube which had been fixed in position during the stupor stage In ten minutes he becomes conscious and the early excitement returns He seizes hold of the attendant and wants to be reassured that he is not dying he is grateful to be reassured a most gratifying symptom in a lost apathetic and inaccessible patient In another five minutes he is quiet but confused He is now rubbed down and changed and is ready presently for the dinner which he eats with good sometimes ravenous appetite

After several days of the treatment the excitement does not occur and the whole induction and recovery is a

very quiet business At this hospital we now premedicate the patients prone to epileptic fits during shock with 2-grain doses of prominal, and have not had any fits since commencing it We regard this as an advance in technique

Clinical Technique

During the treatment the pulse and temperature are recorded at 6 a.m. and 6 p.m. Urine is tested daily at 6 a.m. Slight glycosuria is common whilst the patients are undergoing treatment but stops at the finish of treatment

1 Preliminary Phase—Ascertaining the shock dose

Inject at 7.15 a.m. Start with 20 units intramuscularly, the patient fasting and increase daily by 5 or 10 units according to progress A common shock dose is 130 units. Subsequent shocks are easier to induce than the first, and after a few days it will be found possible to reduce the dose considerably

2 Phase of Daily Shocks—(No treatment is given on Sundays.)

(a) Note that the chart and urine are normal

(b) Inject the insulin intramuscularly at 7.15 a.m.

(c) Thereafter feel the pulse frequently and record it at intervals of fifteen minutes Take the temperature every hour apply hot water bottles if it is below 97 Watch the respirations and be on the lookout for any blueness

(d) The doctor passes the nasal tube lubricated with glycerine as soon as the patient becomes stuporous. It is fixed in position with adhesive strapping so that the part issuing from the nose and lying over the cheek is covered This prevents it from being hooked out by the patient

(e) At 12.15 p.m. pour in the glucose solution

(f) As consciousness returns remove the tube Give the patient two dessertspoonfuls of golden syrup if he likes it

(g) Take the patient out of bed rub him down vigorously and dress him in front of the fire

(h) Most important (perhaps a great part of the success of the treatment depends on this), someone must be continually at hand to reassure and mother the patient during his return to full consciousness

(i) Ordinary dinner at 1 p.m.

(j) During the afternoon at about 5 o'clock usually the patient may go off into a coma again Try to prevent this by giving glucose the doctor should be called The nasal tube is got ready (This complication has been uncommon in our experience)

The Team Drill

1 Administration of the Insulin

The second nurse waits upon the charge nurse who gives the insulin

2 Passage of the Nasal Tube

(a) The third nurse takes a test tube containing blue litmus paper stands at the head of the bed and steadies the patient's head

(b) The doctor stands at the patient's right side

(c) The second nurse hands the lubricated nasal tube and stands back

(d) The doctor passes the tube

(e) The charge nurse affixes the suture to the tube draw off about half an ounce of gastric juice and squirts it into the test tube held by the third nurse If the litmus turns red it indicates that the tube is in the stomach

(f) The second nurse fixes the nasal tube in position with adhesive plaster and puts a wooden plug in the end of the nasal tube Meanwhile the rest of the team are able to proceed with the next patient

3 The Shock Stage—During the shock period a nurse keeps very close watch and the other two nurses remain within earshot

4 Bringing the Patient Round—During the preceding hour the glucose solution has been measured into pints and kept warm by one of the nurses not watching the patient He now brings in these pints on a tray

(a) The charge nurse affixes the funnel to the nasal tube and holds the funnel while the second nurse pours in the solution.

(b) The plug is reinserted and the two nurses move on to the next patient. The third nurse watches the patients who have had the glucose.

(c) At the first sign of consciousness by the patient the third nurse removes the plaster and withdraws the tube. He watches the patient carefully since he may become very restless.

(d) All four (the doctor and the three nurses) assist in rubbing down the patients, changing them and "mothering" them. This is the time when contact is made with the patient.

Drill for Emergencies

1 *The Patient goes Blue*

(a) *In coma* Two nurses stand one on each side. The first nurse throws back the bedclothes and thereafter attends to the head end of the patient. The second nurse slips his hands under the patient's hips and gently throws him over on to his side towards the other nurse. The first nurse replaces the bedclothes. Meanwhile the third nurse has called the doctor. Such cyanosis is usually due to tongue swallowing.

(b) *Coming out of coma (regurgitated fluid)* In addition to the foregoing the first nurse grasps the patient around the shoulders and holds him half out of bed rolled over the nurse's knees with his head hanging well down to the floor.

2 *The Patient Becomes Violent*—The first nurse holds the patient tight against his body ("hugs him"). The second nurse directs the movements of his arms and legs where they cannot do harm. Meanwhile the first nurse must continue soothing and reassuring the patient. During a quiet period the patient is lifted down on to the floor mattress and his own mattress is lifted down beside it to give as large a protected area as possible. We have found that anything approaching rigid restraint makes the patients more violent.

3 *Disturbance of Respiratory Rhythm*—The doctor must be called immediately. Be prepared to apply artificial respiration if necessary.

4 *The Pulse Falls Below 50 or Rises Above 150*—The doctor must be called immediately.

5 *The Pulse Falls Below 40 or Rises Above 160*—The nurse should administer glucose immediately if the nasal tube is in position. Meanwhile the doctor has been summoned.

6 *Other Emergencies*—If the nurse is worried and the doctor is long in arriving 1 ccm of adrenaline can be given. Theoretically this should terminate the coma. (We have not had experience of this.)

7 *Epileptic Fit*—The nurse should manage this as any ordinary fit. The doctor should be notified. He will terminate the coma.

In practice we have found the following additional points of value. If a patient has a tendency to vomit his glucose solution the addition of an ordinary alkaline powder to the feed will prevent it. If the swallowing reflex is sluggish the nasal tube is sometimes hard to pass. Tap the patient's larynx lightly and the patient will usually swallow. A cigarette tides a difficult patient over his hungry period.

The glucose solution is prepared daily in the ward from commercial crystalline glucose. Six ounces are added to a pint of water. An emergency tray is kept always ready in case a coma should have to be hurriedly terminated. We have ampoules containing 30 ccm of 10 per cent glucose in normal saline solution and the necessary syringes for giving this intravenously. We once terminated a coma by this method; the patient became conscious within two minutes of injecting one ampoule. Adrenaline is also kept on the tray. During the coma we raise the foot of the bed six inches. We use nasal stomach tubes sizes 10 and 12.

Summary

1 Insulin shock treatment is feasible in a rate and a mental hospital without any special dislocation of the normal hospital service.

2 The essential importance of sound team work is demonstrated and a method of training nurses for it is given.

3 The results to be expected are mentioned.

4 A typical insulin shock is described.

5 The technique is explained and the instruction to the nurses is tabulated.

Acknowledgement for permission to carry out this treatment and to publish the results is made to the medical superintendent of the West Ham Mental Hospital Dr J Harvey Cuthbert and thanks are also due to Dr J J Murphy of the same hospital for his valuable support and help.

CARCINOMA OF THE CERVIX IN INDIA THE FIVE-YEAR END-RESULTS*

BY

SUBODH MITRA, M B Calcutta, M D Berlin,
F R C S Ed, M C O G

Associate Professor of Obstetrics and Gynaecology, Carmichael Medical College, Surgeon to Sir Kedarnath Maternity Hospital and to the Seva Sadan Women's Hospital, Calcutta.

Malignant disease of the uterus is as common in India as it is elsewhere. While studying uterine cancer first for three years in Germany and since then in India I found it most difficult to follow up these cases. In Germany I found that many patients changed their residences but it is the custom there to notify the police and the municipal office of the district or ward left as well as of the one entered. Thus there is very little chance of losing sight of a case.

Perhaps the ideal conditions for following up cancer cases are found in Sweden where the Government has made it obligatory for every patient to report when notified if she does not do so she has to account for her failure. Heyman of Stockholm is fortunate in having been able to follow up all his cases year by year for the last decade. In Great Britain Victor Bonney's investigation is perhaps the most complete but in spite of his efforts he could not trace all his cases; he had lost sight of twelve after five years and twenty-three after ten years.

Unfortunately the situation is very different in India. The economic condition of our people renders about half the patients houseless and there is inefficient civic organization there being no arrangement for the notification of change of address. Moreover individual irresponsibility on the part of the patients makes the question of following up extremely difficult. I always try to take three addresses in the case of each patient besides that of the attending doctor if any. Of the three addresses one is that of the patient herself, the second one is of her relatives and the third one of her neighbours. I issue letters periodically to different addresses but unfortunately the response is meagre. For the follow up records of my cancer cases I have considered those cases which could not be traced as dead although we found one or two cases unexpectedly later on to improve the five year statistical results. I encountered one of my patients of 1926 quite recently not being able to trace her I had recorded her as dead.

* Read at a clinical meeting of the Calcutta Branch of the British Medical Association.

Classification of Cases

Assorting my cases for the last ten years—a total of 700—I find that 10 per cent fall in the early group. In my previous communication to the Third International Radiological Congress in Paris in 1931 I classified my cases as early late and terminal, but since then I have been following the international classification of carcinoma of the cervix uteri as recommended by the Cancer Commission of the League of Nations, dividing all cases into four stages according to the anatomical extent of the growth. The classification of Schmitz (1927) is almost the same. He recognizes four groups: (1) clearly localized carcinoma, (2) borderline cases, (3) clearly inoperable cases, and (4) terminal cases with pelvic involvement. Histologically I have followed Schottlander and Kermanner's classification of ripe unripe and mid ripe cells.

Victor Bonney (1935) devised his own classification of carcinoma cervix cases according to whether the regional glands removed at the operation are or are not carcinomatous. His reasons for non-acceptance of the League of Nations classification (which is generally used in radiation therapy) are that he began his work before radiology appeared in the field and secondly, because no useful comparison can be drawn between what one man sees and another thinks he feels. But Bonney's classification cannot be accepted as practical, since it is based on operable cases only in all of which the regional glands are removed. Until a better classification can be obtained it seems advisable to retain that of the League of Nations, which will render comparable the results of investigators in different parts of the world.

Technique of Treatment

There are three different methods of treating cervical cancer: Wertheim's abdominal operation, Schauta's vaginal operation and radiation treatment. Although Wertheim's operation was usual at the beginning of this century the adherents of Schauta's vaginal operation have continued to use this technique on account of the high mortality resulting from laparotomy and the relatively unsatisfactory duration of any benefit obtained in other cases. Shortly before the war some of the French and German gynaecologists began treatment with radiation after the war this treatment was almost universally accepted. The three methods of treatment—namely Wertheim's abdominal operation, Schauta's vaginal operation and radiation—have after about a quarter of a century outgrown the stage of trial and established a certain uniformity: a satisfactory comparison is now permissible and a conscientious worker will decide his plan of treatment on the basis of this comparison.

Wertheim's method has most nearly reached perfection in the hands of Victor Bonney (1935) whose results have been consistently good. Dissection of all the regional glands is the rule rather than the exception in all his 483 cases since 1907. The primary mortality ranges from 9.5 to 20 per cent, an average of 14 per cent. Schauta's operation has been greatly improved by Adler's more extensive vaginal procedure associated with immediate post-operative irradiation. It is useless to perform the ordinary vaginal hysterectomy which passes under the name of Schauta's operation. Free dissection of the ureters with removal of parametrial tissue should be undertaken in each case. The primary operative mortality is about 3.6 per cent. Radiation treatment has yielded the best results at the Radiumhemmet in Stockholm. We all follow more or less the same principles as those propounded by Heyman (1935) who wrote that if

properly applied radium treatment may produce at least as good results as the operative method. Adler (1932) adds that particular importance is to be attached to the word properly because the properly performed radium therapy is at least as difficult to learn as any surgical technique.

Results of Treatment

Table I shows the relative value of the different methods of treatment. The comparative figures from the literature indicate that in the hands of experts the results of radiation therapy might be as good as those of operation but

TABLE I—Comparative Statement of Five Year End results by Different Methods of Treatment (Adler)

Radiation	World literature	17.45 %	
	Borsell Heyman	23.3 %	(21.8 %)
	Bowling Fricke	23.0 %	
	Gray Ward	23.6 %	
Operation	World literature	19.1 %	
	Bonney (abdominal) Schauta (vaginal)	25.0 % 22.5 %	
Operation and Radiation	Franque (abdominal)	28.1 %	
	Pelham (vaginal)	28.0 %	
	Adler (vaginal) 3rd method	31.8 %	

in no case will they exceed them. In irradiation we have a second means of attack against cancer, but no better (Adler, 1932).

Comparing the results of abdominal and vaginal operations, the table reveals almost a similar permanence of cure although the primary mortality of the abdominal operation is on an average nearly four times that of the vaginal operation. The same table shows a decidedly higher proportion of permanent cures by the vaginal operation when combined with post-operative irradiation. This is Adler's achievement which he reported by invitation at the forty-fourth annual meeting of the American Association of Obstetricians Gynecologists and Abdominal Surgeons in 1931. The end results which I present have been obtained solely by radiation treatment consisting of combined radium and deep x-ray exposures. As a rule in this treatment an application of radium element corresponding to 6,000 milligramme hours is given partly in the vagina and partly in the cervical canal. This is supplemented by an intensive course of deep x-ray therapy. Since 1932 I have changed my technique and have been following that of Adler—namely radical vaginal operation with post-operative irradiation.

It seems necessary to state clearly certain fundamental rules of cancer statistics. It is the custom to term a patient cured when at least five years have elapsed since the end of treatment (operation or radiotherapy). Bonney (1935) states that 10 per cent of all recurrences appear between the fifth and tenth years. Five years freedom from recurrence is only a 90 per cent cure but ten years freedom is a 100 per cent. Among the permanently cured we differentiate between relative and absolute cures. The relative cure percentage is found by comparing the number cured after five years with the number operated on or fully irradiated. The absolute cure percentage is found by comparing the number cured with the total number of cancer cases seen or admitted (whether or not operated on or fully irradiated). For cancer statistics the "absolute cure" percentage should always be given because so far as the operative method is concerned the relative cure percentage depends greatly upon the operability rate which varies with individual surgeons.

Figures for end-results also depend upon the efficiency of the follow-up system. In India we are handicapped in many ways. First it is impossible to trace and follow up many patients because they have no fixed residence. Secondly some do not complete the full treatment, after having taken only a part of it they cease attending either because they think that they are cured or they find the treatment too expensive. Thirdly, since quite a large number of them succumb to tropical diseases, the absolute permanent cure rate is considerably affected. In spite of all these difficulties my end results will bear comparison with the results reported by other investigators.

Table II shows the comparative five year end results of irradiation treatment of carcinoma of the cervix by different investigators. Out of 352 cases (from 1926 to 1930) we have obtained 72.7 per cent of absolute cures.

TABLE II—Comparative Five year End results of Irradiation Treatment of Carcinoma of the Cervix Uteri

Classification	Investigator	Percentage of Five year Cures					
		Stage I	Stage II	Stage III	Stage IV	All Cases	
Schmitz	Schmitz 438 cases	80	41.9	16.3	1.7	19.14	
	Schreiner and Wehr (955 cases)	63.1	32.7	17.8	1	11.8	
League of Nations	Paris						
	Lacassagne (350 cases)	42	28	10	0	20	
	Heyman (1,439 cases)	57.5	34.3	1.2	5.3	21.9	
	Stockholm	—	—	—	—	21.3	
	Munich	—	—	—	—	17.6	
	Calcutta	—	—	—	—	20.5	
American College of Surgeons	Barlett and Smith (143 cases)	80	27.3	11.6	3.5	11.9	

in Stage I cases 41 per cent of absolute cures in Stage II cases 11.5 per cent of relative cures in Stage III cases and taking all the stages together 20.5 per cent relative cures and 11.1 per cent absolute cures. I am convinced that this percentage could be raised by making the treatment less costly and thus more accessible to patients and by securing their co-operation.

Table III indicates the number of positive five year cure cases year by year and stage by stage numbering forty. Table IV records the total number of cases admitted the total number taking the full course of treat-

TABLE III—Positive Five year Cure Cases of Carcinoma of the Cervix Uteri

Year	Stage I	Stage II	Stage III	Stage IV	Total	Grand Total
1926	1	3	1	—	5	43

Conclusion

In conclusion I must add that the percentage of cures could be greatly increased by earlier diagnosis using every means of investigation. We want our medical institutions to take the initiative. Every student should be alive to the question of early detection of cancer and every medical practitioner should know that these cancer cases are of frequent occurrence.

Early cases are first encountered by the general medical practitioners. If we really want to increase the number of cases receiving early treatment we shall have to get the sincere help and co-operation of our colleagues. Cancerphobia will not kill a person but a neglected and

undetected carcinoma of the cervix will lead to certain death

The task is very difficult. Even Victor Bonney states 'Nor have I observed that patients in more recent years present themselves earlier in spite of modern propaganda. Lastly, the work of cancer investigation cannot be complete unless substantial help and co-operation come from the corporation and the Government'

HYPERTROPHIC PULMONARY OSTEO- ARTHROPATHY AS THE FIRST SYMPTOM OF PULMONARY NEOPLASM

BY

J W CRAIG, M A, M D

Late House Physician Brompton Hospital London Dorothy
 Temple Cross Research Fellow in Tuberculosis 1935-6

Hypertrophic changes in the fingers have often been described in diseases of the lung. The following case reports are published because in each patient changes in the limbs formed the earliest symptom of a pulmonary neoplasm. Three cases were diagnosed and treated as rheumatoid arthritis the fourth was sent to the National Hospital Queen Square as suffering from acromegaly. Had the true significance of the changes in the limbs been realized the growth in the lungs might have been treated several months earlier.

Case Reports

Case 1—In April 1933 a man aged 56 began to notice that his feet and ankles were becoming larger; he could not get his boots on and his knees felt stiff and uncomfortable. In October 1933 his hands began to feel large and lumpy; they gradually became weak and stiff and he had to give up his work. By November 1933 in spite of rest his elbow joints and shoulders had become stiff; he developed a very slight cough but had no sputum. In December 1933 he was sent by his doctor as suffering from acromegaly to the National Hospital Queen Square where hypertrophic pulmonary osteoarthropathy was suspected. His chest was radiographed and a provisional diagnosis of pulmonary neoplasm made. In January 1934 he was admitted to Brompton Hospital. The only abnormality discovered in the chest was impaired resonance at the right apex. His teeth were in good condition his blood pressure was 140/30 and the heart sounds were normal. He had marked and painful hypertrophic pulmonary osteoarthropathy of the hands and feet. Bronchoscopic examination failed to reveal any abnormality although radiography had shown a rounded shadow in the right upper lobe suggesting the presence of a neoplasm. Radiography of the limbs showed new periosteal bone round the metacarpals phalanges radius and ulna. In view of the increasing severity of the symptoms it was felt that surgical removal of the primary cause offered the only hope for the patient. Pneumonectomy was performed but owing to his low condition the patient survived the operation only a short time. Examination of the removed lung showed a large columnar-celled carcinoma growing from the right main descending bronchus.

Case 2—In December 1931 a married woman aged 58 who had previously felt very well began to have rheumatic pains first in the feet then spreading to the hands and left shoulder. In May 1932 she noticed that her hands were

larger and that the tips of her fingers were getting broader. In July 1932, she went to a clinic and was treated for rheumatism but did not improve. In the following August she developed a slight cough and a feeling of lassitude and in November she was admitted to the Brompton Hospital complaining of lassitude and pains in the joints especially those of the fingers and left shoulder. On examination the left apex was dull to percussion and the breath sounds were poor. One small gland was found in the left axilla. The hands were broad and the fingers "drumstick", while the bases of the nail beds were red and swollen. The interphalangeal joints were stiff and painful to move and there were similar changes in the feet. Radiography of the chest showed a dense opacity in the upper and middle zones suggesting atelectasis and the presence of a neoplasm. The left hand and foot showed the typical changes of hypertrophic pulmonary osteoarthropathy. The ungual phalanges and the radius and ulna had bony like expansions at the distal ends. In the tibia and fibula new periosteal bone was laid down in the form of an irregular capsule. The patient was given deep x-ray therapy but a radiograph one month later revealed no change in her condition.

Case 3—In November 1931 a man aged 53 first noticed pain and swelling in the knee joints. This was treated as housemaid's knee, but did not improve. The pain and swelling then spread to the ankles wrists elbows and shoulders (in that order) and a diagnosis of rheumatoid arthritis was made. In February, 1932 he noticed that his fingertips were becoming larger at this time he was being treated at Bath. His medical attendant found suspicious signs in his lungs although the patient had not complained of any pulmonary symptoms. A radiograph of the chest was taken and he was then sent to the Brompton Hospital out-patient department where a radiograph (August 1932) revealed a large mass at the base of the right lung. A few rhonchi and weak breath sounds were heard at this base. Shotty glands were found on both sides of the neck and a large smooth gland was palpable in the right axilla. Nothing else abnormal was discovered. The knees ankles and wrists were generally enlarged but there was no limitation of movement. The fingers were drumstick in shape and the small joints of the fingers and toes were thickened. The bones showed typical periosteal thickening. On bronchoscopic examination a small nodule was detected projecting from the posterior wall and partially occluding the lumen of the right main descending bronchus. A portion of this was removed and was found to be a squamous-celled carcinoma. Radon seeds were inserted through a bronchoscope. In November 1932 radiography showed no change in the opacity but the condition of the joints was less painful. In July 1933 the patient was keeping well and working; he had neither cough nor pain. The fingers were unchanged. In January 1934 another radiograph showed no change in the opacity and the patient was still well and working.

Case 4—In April 1932 a man aged 45 found that his knees were swollen; they were painful while walking, but were relieved by rest. He was told by a medical practitioner that he had rheumatoid arthritis and was given an ointment to rub into them. In May the patient first noticed that his fingers were swollen; this swelling steadily progressed. In June he underwent an operation for appendicitis. In August a pain in the right scapular region began. He continued with his work until November when cough developed with dyspnoea on exertion. He was admitted to Brompton Hospital in February 1933. There were a few discrete glands in the groin and the breath sounds at the right base were weak. Well marked drumstick clubbing was present in both hands. Radiography showed an opacity at the base of the right lung and a bronchogram indicated that the lipiodol had failed to fill the right descending bronchus at the site of the opacity. Bronchoscopic examination revealed a red granular area in the lateral secondary division of the right descending bronchus. A portion of this was removed and proved to be carcinomatous. Thoracotomy was performed in the hope of removing this growth but a firm mass—the size of a cricket ball—was found in the right lower lobe invading the middle lobe and extending into the hilar region.

Since this was considered irremovable radon seeds were inserted and the patient was discharged in a somewhat improved condition

Clinical Signs

Clubbed fingers were mentioned as a symptom of tuberculosis by Hippocrates and French writers of the present time call them *doigts hippocratiques*. Hypertrophic pulmonary osteoarthropathy, however, was not described until P. Marie (1890) published his account. Bamberger (1891) drew attention to the disease independently almost at the same time.

The actual deformity in clubbed fingers is as follows. The fingers of both hands are thickened and bulbous and the terminal phalanges are enlarged. The nail beds may be red and swollen and the nails are curved longitudinally and laterally. The bones and joints are not affected nor is the skin itself changed in any way. Trousseau likened the change to the head of a serpent.

In hypertrophic pulmonary osteoarthropathy the changes may not affect the tips of the fingers first. In fact the metacarpo-phalangeal region may remain normal. Marie described the disease as follows. Symmetrical osteitis of the four limbs chiefly localized to the phalanges and terminal epiphyses of the long bones of the forearm and leg sometimes extending to the roots of the limb and flat bones and accompanied by a dorsal and lumbar kyphosis and some affection of the joints.

Radiography may reveal proliferative changes in the ungual phalanges. New subperiosteal bone is laid down and sharply marked off and sometimes there are irregular burr-like expansions in the distal half. More rarely small osteophytes are present at the proximal end near the line of joint cartilage. Changes in the joints may affect the peri-articular tissues early. Later erosion of the cartilage may take place with lipping.

Kessel (1917), Montgomery (1916), Locke (1915) and others have observed many cases and believe that clubbing represents the early stage of hypertrophic pulmonary osteoarthropathy. They found that when there was simple clubbing clinically bony changes were present on x-ray examination. Lassere (1932) considered that vasomotor and venous stasis formed a favourable soil, and that there might be a deformity of the soft parts only, the presence of toxins being necessary for new bone formation.

Aetiological Classification

The underlying causes seem to divide the patients into two main groups.

1. Patients in whom there is some element of toxic absorption, such as (a) pulmonary suppuration as in lung abscess, bronchiectasis and empyema or (b) chronic intestinal infection and toxæmia, as in biliary cirrhosis, chronic diarrhoea, rectal polypus and sprue.

2. Patients in whom clubbing appears to be due to cyanosis and right-sided heart failure as in chronic pulmonary tuberculosis and in pulmonary fibrosis and heart disease particularly the congenital disorders.

In the toxic group the changes may come on very rapidly as in lung abscess when the fingers are generally sausage-shaped, red and swollen. In this type of patient the condition of the fingers tends to clear up after the source of the toxins has been removed. In several patients with bronchiectasis and marked clubbing the condition of the fingers almost vanished following the eradication of the diseased area by lobectomy.

Clubbing nearly always improves in lung abscesses treated adequately. Puig (1932) reported hypertrophic

pulmonary osteoarthropathy in a patient with an acute abscess of the lung with rapid disappearance of the clubbing as the lung condition improved. The disappearance of the capsule was only comparable with that seen in syphilitic dactylitis energetically treated. The same has been found with clubbing in intestinal infections. Moulonquet and Salomon (1932) described the clubbing in two patients suffering from colitis and stricture of the rectum in both the clubbing cleared up following colostomy and rectal lavage.

The second group appears to be associated with cyanosis and right-sided heart failure. It is well known that clubbing is common in and is diagnostic of those forms of congenital heart disease which produce cyanosis and dyspnoea. Fishberg (1932) found that whenever clubbed fingers occurred in phthisis the patient was also suffering from dyspnoea and dilatation of the right side of the heart. This would suggest that there was a mechanical disturbance of the circulation causing peripheral stasis which is probably also the basis of the clubbing which develops in congenital heart disease.

Jones (1931) considered that when the soft tissues only were involved the cause was peripheral dilatation and slowing of circulation due to right-sided heart failure. He found clubbing present in 40 per cent of congenital heart lesions and in 25 per cent of cases of subacute endocarditis. He believed that in the latter the clubbing was due to a local disturbance as opposed to the general cardiac back pressure in congenital heart lesions. Others have reported clubbing in subacute endocarditis and Puig (1932) noted it as the first sign in one of his patients. Whether the clubbing is due to general toxæmia to something akin to Osler's nodes or merely to cardiac failure is not known.

Conclusion

In spite of much discussion little is nevertheless known or understood of the true pathology or aetiology of the changes in the limbs described here. Why should hypertrophic pulmonary osteoarthropathy appear in some patients with pulmonary neoplasm when there is no evidence of either obstruction to the flow of blood through the lungs or of absorption of toxins? None of the patients reported here showed any symptoms suggesting either factor.

Some writers suggest that these changes are due to metabolic toxins produced by the breaking down of body tissues the toxins causing a vasomotor disturbance with peripheral dilatation of the capillaries. While the pathology of the disease remains so obscure the clinical connexion between the changes in the fingers and those in certain pulmonary diseases should not be overlooked. These changes as we have seen may appear before any other clinical sign. They will if recognized lead to an earlier diagnosis and treatment of the underlying condition.

Summary

1. Four cases with pulmonary neoplasm are reported in which the earliest symptom was hypertrophic pulmonary osteoarthropathy.

2. The aetiology of this condition is briefly discussed and the relevant literature reviewed.

It is suggested that investigation of the lungs should not be overlooked in patients with rheumatism or with changes in the joints appearing without known cause as well as in those with acromegaly.

I wish to express my thanks to Dr L. S. T. Burrell and Mr A. Tudor Edwards for their kind permission to publish.

the notes of the patients who were under their care at Brompton Hospital London

OCULAR PARALYSES FOLLOWING MUMPS

BY

T HARRISON BUTLER, D M OXON

Late Ophthalmic Surgeon

AND

A J WILSON, M D Ed

Honorary Physician Coventry and Warwickshire Hospital

The comparative rarity of the neurological complications of mumps and their unusual localization and termination in one of the two following cases have led us to put them on record

Case I

A boy aged 9 came to the Coventry school clinic in December 1929 because he had recently found that he could not see to read. While at the clinic he vomited and it was noticed that a large quantity of the vomit came through the nose. He had had mumps three weeks previously and a fortnight before admission he noted that he could not see to read. For the past fortnight food had regurgitated through his mouth.

There was complete paralysis of accommodation the pupils were widely dilated and did not react to light. No external muscles were affected. The vision was as follows: right eye 6/60 with +2 = 6/9 and the left eye 6/60 with +2 = 6/9. There was slight blurring of the edges of both disks. The knee jerk was absent on the right side and its presence on the left was doubtful. The boy was admitted to the eye wards of the Coventry Hospital. A swab was returned as negative for the Klebs Loeffler bacillus. He was transferred to the medical wards and lost sight of.

He was written for and examined on July 4 1934 when he was aged 14. The disk edges were still somewhat blurred but the eyes were apparently quite normal and there was no evidence of any paresis of any extrinsic or intrinsic muscles. At the time of the first visit we found that Osler in his *Textbook of Medicine* had mentioned that mumps was occasionally followed by peripheral neuritis.

The case may be summed up as an example of the picture presented by post-diphtherial paralysis of the intrinsic muscles of the eye but caused by the virus of mumps. It is probable that the slightly blurred disks were physiological and had nothing to do with the infection.

Case II

Another boy aged 12 came to the Eye Department of Coventry Hospital on March 15 1933 complaining of blurred vision in the left eye and inability to see things on the right side without turning the head in their direction. The symptoms had come on gradually a few days previously. One month before this date he had developed mumps. The attack was of ordinary severity and he did not stay in bed. A sister had suffered at the same time. There had been no headache fits, or any cerebral symptoms. His previous health had been very good. One brother had died recently from

pulmonary tuberculosis and a sister from meningitis probably tuberculous.

We found that the vision in the right eye was 6/24 and with glasses 6/45. In the left eye it was 6/24 and with glasses 6/18. Both fundi were normal. All the intrinsic and extrinsic muscles supplied by the third nerve were paralysed on the left side. The pupil was widely dilated and inactive. There was incomplete left ptosis with compensatory overaction of the left half of the frontalis. Food regurgitated through the nose. The general nervous system was normal. The Mantoux and Wassermann tests were negative. No Klebs Loeffler bacilli were found. There was a history that twelve months previously the left eye had been struck by a golf ball and that two stitches had been put into the lids one into each. The eye was not damaged, and there was no diplopia after the blow.

On March 17 paresis of the left external rectus appeared the superior oblique remained active. On May 23 the paralysis of the eye muscles was reported to be improving and on June 19 the eye movements were almost normal. On July 17 all the eye movements were normal except convergence. The pupil was still dilated. On August 21 the left pupil was still dilated and inactive and upward movement of the eye was defective. No change was noted on October 2 December 11 or December 18. The vision of the right eye was 6/45 and of the left 6/18 partly (with glasses).

On January 15 1934 there was slight defect of convergence and abduction. The pupil was still dilated and inactive on March 5. Convergence was still defective. There was no change on April 9. On May 14 there was still third nerve paralysis the left pupil was fully dilated and inactive. The fundi were normal. The condition was not so good as previously. In November there was still no change or improvement.

Comment

Numerous investigations of cases of uncomplicated mumps have shown that a meningeal reaction, as indicated by a lymphocytic pleocytosis, is present in most cases of this disease, even in the absence of any symptoms or signs indicative of cerebral involvement. It seems probable that the virus of mumps is itself potentially neurotropic, since several cases are on record in which clinical meningitis and encephalitis have preceded the onset of the glandular swelling. The pathology would therefore seem to be distinct from that of the cerebral complications of the other virus diseases (such as vaccination, varicella and encephalitis) in which it is generally held that the neurological complication is caused by a dormant virus which has been awakened to activity by the attack of the exanthem.

The peripheral nerve palsies accompanying mumps are often considered to be of the same nature as those associated with various toxins and infections and to be a lesion of the peripheral nerve endings but in view of the frequent meningeal reaction of parotitis it would seem equally likely that in some cases the lesion is one of the nerve trunk near its root (a meningoradiculitis). This would bring the pathology into line with that of the peripheral (cranial and spinal) nerve palsies associated with the various forms of meningitis acute and chronic.

The time of onset of the neurological complications is usually at the height of the parotitis while it is subsiding or in the early period of convalescence (third to fourteenth day). Periods of three weeks have been recorded. The longer interval of six weeks in Case II is unusual.

It appears certain that in some cases cranial nerve palsy due to the mumps virus may occur in patients in whom there has been no apparent parotitis and no orchitis, as is shown by the occurrence of such palsies in contacts in barracks during epidemics and in a member of the family of a definite parotitic patient. The possibility of such an

origin has therefore to be borne in mind in all cases of unexplained cranial nerve palsies. In the almost constant meningeal reaction of mumps may also lie the explanation of many cases of acute aseptic benign meningitis without parotitis.

Of the cranial nerves involved the optic, the facial and the acoustic are the commonest in the recorded cases. The third nerve and the post-diphtherial type of palatine and accommodation paralysis are much rarer. The benign and often transitory character of the effects on the nerves which result from the penetration of the sero-fibrinous exudate into their trunks at their origins and the pressure on these from the inflamed meninges have been emphasized. The two notable exceptions to this are the optic and acoustic nerves, where atrophy is apt to follow with disastrous consequences. The two cases here recorded are therefore of interest in the type of nerves involved and in the absence of recovery in one.

Clinical Memoranda

Local Anaesthesia in the Repair of Torn Perineum

Anyone who has had any experience with cases of prolapse of the uterus and vagina cannot fail to be impressed by the enormous weight of evidence in favour of lacerations of the perineum as a contributory factor in the aetiology of this distressing condition. While holding an appointment as a house surgeon I saw a large number of such cases and took a careful obstetric history from each. There were two points which struck me as being of great importance: (a) practically every patient gave a history of a perineal laceration; (b) a large number of patients said that either their doctors did not repair the tear or that the midwives did not call in a doctor to see the tear.

Margaret Salmond and Gertrude Dearnley (*J Obstet Gynaec Brit Emp* 1935 p 446) in an investigation into this subject showed that midwives were inclined to overlook tears and that results obtained by general practitioners were not very good. However they offered no explanation why the practitioners' results were poor. The reason is I think that as the practitioner usually has no skilled anaesthetist at his disposal he is forced to do the operation without an anaesthetic at all and in his effort to spare his patient as much discomfort as possible he hurries the procedure with the result that it is not properly done. Therefore we need a method whereby anaesthesia can be produced easily, effectively and single handed by a general practitioner. When the procedure is carried out in the patient's home naked lights such as fires, gas-flames, etc. preclude the use of inflammable anaesthetics. A gas-and-oxygen apparatus is expensive and clumsy and needs a second skilled person to manage it. A small bottle of novocain solution, a 5-cm syringe and a needle in a sterile container occupy very little space and may be carried in the pocket. The practice of allowing midwives to repair the tear while the practitioner administers the anaesthetic is one to be most strongly condemned.

TECHNIQUE

The patient having been placed in the lithotomy position with sterile towels in place and the vulva thoroughly cleaned and painted with such antiseptic solution as the operator is in the habit of using (Bonney's blue staining, etc.) a 5-cm syringe is filled with 4 per cent novocain solution. The skin edges of the tear are infiltrated throughout their entire length. The infiltration should be done internally and the skin not punctured at all. This is usually all the infiltrating that is necessary since the torn deeper structures are as a rule insensitive to pain. In tears involving the levators, however, I have found that the muscles are sensitive and I recommend their infiltration. About 4 ccm of 4 per cent novocain solution is sufficient for the average repair. The largest amount that I have used was 10 ccm for a complete tear involving the whole of the posterior vaginal wall, the rectum and external sphincter. I recommend the repair being done within two hours of delivery as at the end of this time sensation begins to return to the deep structures.

RESULTS

All the patients have expressed their gratitude for not having been put to sleep and some who have had previous repairs have compared this method very favourably with the others they have had with general anaesthesia or with no anaesthetic at all.

The healing has in all cases been most successful and I have had none which have broken down or gone septic. It has been suggested to me that the novocain might cause soddening of the tissues in this potentially septic area and therefore the procedure might be considered risky. Such quantities of novocain which would cause this are never necessary to produce the required anaesthesia and no ill effects have followed its use in any of my cases. These observations are based on over 100 cases in hospital and on the district.

CONCLUSIONS

- 1 Suture of perineal lacerations is essential and unless done thoroughly is useless.
- 2 The anaesthetic of choice is local infiltration.
- 3 Infiltration of the skin edges is usually all that is necessary and should be done internally and the skin not punctured.
- 4 It is an extremely practical method for general practitioners.
- 5 It is very much pleasanter for the patient.
- 6 The use of general anaesthesia for the repair of even large tears is both undesirable and unjustifiable.

STANLEY WAX, M.R.C.S. L.R.C.P.

Late Senior Resident Medical Officer
General Lying-in Hospital, Lambeth

P. Klotz (*These Paris* 1937 No 35) maintains that polyneuritis is most likely to develop in female subjects as they are particularly susceptible to endocrine disturbance. Experimentally a previous upset of the endocrine system by ovariectomy makes it impossible to produce that habituation to alcohol which it is easy to obtain in the healthy animal. On the other hand such an attempt at habituation results in the production of a state of hypersensitivity to the poison. Alcohol in polyneuritis develops after a more or less prolonged period of dyspepsia with atrophic gastritis and degenerative hepatitis and is more often produced in such cases by infections of which tuberculosis is the most important. It sometimes appears in an individual who has abstained from alcohol for some weeks or months. This polyneuritis is very often associated with anaemia and pronounced endocrine disturbances among which thyro-ovarian insufficiency predominates.

Reviews

MUSINGS OF A PHYSICIAN

Meditatio Medici A Doctor's Philosophy of Life By W Cecil Bosanquet D.M. F.R.C.P. (Pp 162 7s 6d net) Aldershot Gale and Polden 1937

Reviewers are traditionally believed not to read the books they review, but the most hardened reviewer would find it difficult to skip Dr Bosanquet's *Meditatio Medici* which in the small compass of 162 pages runs through the whole gamut from interstellar space to the intricacies within the atom, discussing, by the way, man, his development his conscious mind and his principles of conduct. Even the footnotes are illuminating and frequently amusing.

In these days of increasing specialism, where the knowledge of one expert is not readily available for another working in a different department, a book of this kind is refreshing especially when bearing the marks of wide reading and much reflection, excellently phrased in scholarly English. If we might venture any disparagement where we have received so much pleasure we might protest that a good deal of what the author says on education amounts to truism though we will qualify this by defining a truism as truth which people generally accept but seldom act upon. And there is sound truth in his plea that morality seems to penetrate the system most subtly and to take the firmest hold when it is inhaled from the social atmosphere surrounding the child rather than when it is deliberately thrust upon its attention. There is something to be said, moreover, for his view that standardized education may result in a levelling down, in effect a trade union *ca canny*.

The author's account of so much physics chemistry, and biology as bears on his main theme is lucid and free from technicalities as is his summary of anthropology. His speculations on the origin of sacred fires such as that of Vesta in Rome are of interest and we liked his suggestion that the tendency of children to construct huts in trees is the revival of an instinct derived from arboreal ancestors. It reminded us that a play which is so illustrative of regressive tendencies ends with Peter Pan in a hut on the tree tops in Kensington Gardens.

The title inevitably recalls Sir Thomas Browne to the mind perhaps intentionally so to emphasize the difference between seventeenth century thought and that of to-day. Thus, said Browne is man that great and true Amphibium, whose nature is disposed to live not like other creatures in diverse elements but in divided and distinguished worlds. Gone are the discursive though delightful musings of those days the poppy of oblivion has blindly scattered its opium upon them to day we are seeking a more unifying philosophy and we are grateful to Dr Bosanquet for trying to help us to find one.

ANAESTHESIA AND ANALGESIA

Recent Advances in Anaesthesia and Analgesia (including Oxygen Therapy) By C Langton Hewer M.B. B.S., D.A. Second edition (Pp 284 11s figures 15s) London J and A Churchill 1937

This work needs no introduction, for the first edition was published less than five years ago. In order to bring the second edition up to date a good deal of rewriting has been necessary and descriptions of four new anaesthetic agents have been added. These are cyclopropane diethyl ether sodium evipan and pentothal sodium. There are also chapters on carbon dioxide and oxygen as therapeutic agents. Besides chapters on the commonly employed

anaesthetic agents and their various types of apparatus space is also given to such subjects as the risk of explosion in anaesthesia and modern methods of local analgesia, including its use in the reduction of fractures. Special attention is also given to the different branches of surgery, such as cranial, thyroid thoracic, and abdominal, and the best methods of anaesthesia for them.

In order to keep the size of the book within reasonable limits Dr Hewer has had to be brief where no doubt he would have preferred to write at greater length. Nevertheless he has contrived to deal adequately with every subject of importance to the modern anaesthetist. He has supplemented his text with a useful list of references at the end of each chapter, so that the reader who wishes for fuller information on any point will know where to look. The book is not intended as a textbook for the student. Descriptions of signs and stages of anaesthesia are absent. But for the established anaesthetist who wishes to learn the latest views on the various branches of his specialty there is something of everything. It should prove popular with those working for their diploma in anaesthetics.

PHENANTHRENE DERIVATIVES

The Chemistry of Natural Products Related to Phenanthrene By L F Fieser (Pp 358 32s 6d net) New York The Reinhold Publishing Corporation London Chapman and Hall Ltd 1936

This volume, by Professor L F FIESER of Harvard, is No 70 of the American Chemical Society series of scientific and technological monographs. It has the essential qualities of a good monograph, since the author gives a thorough account of a special field of knowledge. Further more it is of exceptional value because the phenanthrene derivatives are a group whose biological importance has increased in a sensational manner during recent years. The presence of phenanthrene in coal tar was discovered in 1872 but the compound was neglected because it refused to yield valuable dyes. Morphine was recognized as a phenanthrene derivative as early as 1881, but the great biological importance of the group has only been established during the last decade. In 1928 Wieland and Windaus established the structural formula of cholesterol, proved its relationship with the bile acid and showed that both were phenanthrene derivatives. About the same time it was discovered that the antirachitic vitamin was a derivative of ergosterol.

Since that time it has been ascertained that the sex hormones are sterol derivatives, that the cardiac glucosides have a very similar structure and that the most active carcinogenic agents are phenanthrene derivatives. These remarkable discoveries have naturally provoked intense activity in biochemical circles and the author mentions that 45 per cent of his references are to work carried out in the lustrum 1930-4 while 23 per cent refer to work published in 1935. This sudden rise to fame of a relatively obscure and neglected group of compounds is one of the most striking recent events in biochemistry. The basic sterol ring contains 17 carbon atoms, and small alterations in the side chains often produce great changes in the biological activity. Hence the relation between the chemical structure and the biological activity of sterol derivatives is one of the more difficult and complex fields of biochemistry. The author succeeds in giving a very clear account of this difficult subject, an account that is greatly simplified by the lavish use of structural formulae.

The rate at which the complexity of the subject is growing may be judged by the fact that it was not until

1929 that a sex hormone (oestrone) was isolated in a pure state, while the author gives a chart of no fewer than twelve different sex hormones established in 1935 a number which has indeed increased during the last year. He recognizes the difficulty of describing a subject which is in the course of such rapid evolution but puts forward the opinion that probably the basic facts have been correctly determined and that future advance will be an expansion rather than a drastic revision of current opinions. His book will prove of very great value to research workers in a wide field, for the bulk of the recent literature on this subject has been too great to be followed by any except specialists on this branch of chemistry.

BOOKS ON PAEDIATRICS

The 1936 Year Book of Pediatrics Edited by Isaac A. Abt D.Sc. M.D. (Pp. 507, 87 figures, 2.50 dollars or 10s. 6d. postage 6d.) Chicago: Year Book Publishers. London: H. K. Lewis and Co. 1937.

Sick Children: Diagnosis and Treatment By Donald Paterson B.A. M.D. F.R.C.P. Second edition. (Pp. 690, 76 figures, 15 plates, 12s. 6d. net.) London: Cassell and Co. 1937.

Les Régimes chez l'Enfant By L. Babonneix. Pp. 608, 75 fr.) Paris: Masson et Cie. 1936.

Manuel de Puericulture By P. Lereboullet. Second edition. (Pp. 227, 55 figures, 22 fr.) Paris: Masson et Cie. 1936.

Aids to Diagnosis and Treatment of Diseases of Children By F. M. B. Allen M.D. M.R.C.P. Seventh edition. (Pp. 330, 4s. 6d.) London: Baillière Tindall and Cox. 1937.

Dr I. A. Abt has again edited a year's gleanings from the paediatric world literature with the collaboration of Dr A. F. Abt, and publishes them under the title *The 1936 Year Book of Pediatrics*. It is explained in the preface that although there are no outstanding advances to be recorded for the year under review steady progress is being made in many directions especially in the fields of vitamins and of virus diseases. An interesting feature of this 1936 volume is the inclusion of certain abstracts dealing with the aims and significance of children's hospitals. As in preceding issues, quite the most valuable part of this year book is the assortment of comments by the editor in small print at the end of certain abstracts. It is gratifying to see that a reasonable proportion of space is given to abstracts of contributions to the *Archives of Disease in Childhood*.

Steady progress is also indicated by the revisions and new material in the second edition of *Sick Children: Diagnosis and Treatment* by Dr Donald Paterson which appears seven years after the first. Perhaps the greatest changes are to be found in the chapter on blood diseases which now gives an up-to-date account of the principal disturbances with a useful collection of prescriptions. The use of small print throughout this edition for the less common maladies has enabled the author to keep it down in length and the resulting compact volume of just under six hundred pages has been achieved without the sacrifice of a good quality paper. A useful addition is a table of normal biochemical data presented immediately inside the front cover.

Diet for Children by Dr L. Babonneix is an ambitious work excused so to speak, by the author in a disarming introduction on the grounds that great advances in the scientific basis of nutrition have been made in recent years and that most books on this subject are concerned almost exclusively with young infants while he has carried on the principles and practical applications right through

childhood to early adolescence. The volume of nearly six hundred large pages is divided into three main sections. The first gives an outline of the general biological principles of dietetics and it is clear that the author has read widely in an extensive literature in order to present the facts in an interesting and accurate fashion. The middle section of the book is essentially an up-to-date manual on infant feeding in which due emphasis is placed upon the many advantages of natural breast feeding. After dealing in some detail with the normal infant the author proceeds to describe the dietetic aspects of treating infants suffering from various disorders and special types of dietetic material are discussed. The third part prescribes the correct feeding of children from 2 to 15 years of age in health and disease. Unfortunately the daily diet sheets are scarcely applicable in this country. To see nursery menus set out in French is novel and so appetizingly do they read that a possible method of dealing with trouble some anorexia suggests itself. Dr Babonneix is to be congratulated upon producing what will undoubtedly be regarded in French paediatric circles as a standard textbook on all that pertains to diet.

Professor L. Lereboullet's *Child Welfare Manual* has been carefully revised for a second edition and this modest little book can be heartily commended to those who wish to know how these things are done in France. Line drawings enliven the text and add to the value of the book. A pre-war chart (after Budin) shows the then common enormous increase in infantile mortality in the summer months. It would be more instructive to show what is happening to-day when winter diarrhoea from upper respiratory tract infections threatens to dominate the infant mortality returns.

Another new edition the seventh of *Aids to the Treatment of Diseases of Children* by Dr F. M. B. Allen of Belfast well maintains the reputation already held by this little book. New sections deal with the treatment of asthma and of pink disease. The prescriptions given at the end form a most useful addition to a thoroughly practical volume.

SOCIAL PROBLEMS OF DEAFNESS

Deafness and Commonsense By James Kerr Love M.D., F.R.F.P.S., LL.D. (Pp. 160, illustrated, 5s. net.) London: F. Muller.

Dr KERR LOVE has produced a little book which should be of great help to all interested either directly or indirectly in the social problems connected with deafness. The title gives a good indication of the purpose of the book for the author is concerned to show the nature of deafness how its effects may be best alleviated and how much can be done to improve the position of those whose lives are handicapped by the impairment or loss of hearing. Such a book is the best antidote to the quackery and exploitation to which the deaf are constantly subjected by the unscrupulous and the credulous and it is to be warmly recommended to all who need an accurate account in simple language of a problem which faces many parents, relatives and sufferers themselves.

Dr Kerr Love treats the subject from three aspects: to explain the nature of deafness, to show how the hard of hearing can make the best use of the hearing capacity they still possess and so help themselves, and to show the way in which deafness may be prevented. The problem is so largely a social and eugenic one that the co-operation of the public is essential and this book is an excellent

guide to that intelligent co-operation Dr Kerr Love is famous for his life long devotion to the interests of the deaf, and his latest publication increases the indebtedness of the deaf and their teachers to him. He adds a further interest to his tale by an account of the education and life of Helen Keller, the wonderful story of triumph over apparently insuperable disabilities.

Notes on Books

La Revolution Alimentaire Actuelle Ses Consequences Biologiques is a book of 192 pages by Dr G BELTRAMI (Paris Vigot Freres, 30 fr). "Eat dry, eat hard eat actively, eat in earnest" is the advice which Dr Beltrami gives the world if it would stave off the injury which modern civilization is inflicting on it. The particular harm is the decay of tooth, jaw, and face. Dr Beltrami has a simple faith and a simple cure for all the ills of the flesh. His doctrine is that we are being ruined by soft food, soft bread, soft drinks, use of jaws is necessary for health of teeth and face. If a way could be found he would make the child in the womb use its jaws. A hard teat an ivory ring for infants, wholemeal bread and tough joints for adults would soon put our jaws and teeth to rights.

The well known reference book issued annually by the Charity Organization Society under the title of *Annual Charities Register and Digest* continues to reflect the widespread interest taken in maternity and child welfare. Information on administrative agencies maternity and child welfare clinics, maternity homes, children's hospitals etc. which before 1935 were scattered through several different sections of the work, is now collected into one under the heading Maternity and Child Welfare. Copies of the 1937 edition of this very useful book may be obtained from the Charity Organization Society, Denison House, Vauxhall Bridge Road, SW 1 (cash price 8s 6d in the United Kingdom).

In a communication to the second Argentine Congress of Social Medicine, entitled *El Problema de los Incapaces por Accidente* (Rosario Libreria y Editorial Ruiz Cordobe) Dr JUAN CARLOS ALVAREZ maintains that official institutes for the study of injuries and the re education of the disabled should be created at once in order to prevent the accumulation of such incapacitated persons so far as possible. The function of such institutes should be to determine the percentage of permanent incapacity so that the proper compensation may be made.

The *Dentists Register* for 1937 has now been published for the Dental Board of the United Kingdom by Constable and Co Ltd, price 12s post free 12s 6d. The total number of names appearing on January 1 of this year is 14 706 being 201 more than the figure for 1936. Of these 8 399 (57.11 per cent) are registered with medical surgical or dental qualifications. The number of names added by registration was 470 including 107 foreign and seven colonial dentists.

Dr CLIFFORD ALLEN has written a monograph entitled *Modern Discoveries in Medical Psychiatry* (Macmillan 8s 6d). Perhaps the title is somewhat misleading as the author gives us a very interesting historical study of the developments of psychological medicine from the time of Mesmer and his discovery of hypnosis to the researches of Pavlov. Then we come to the work of Janet. It is true that Janet was not favourable to the theory of the unconscious but his clinical work was illuminating and the psychiatrists of that time greatly profited from his teachings. Then Morton Prince was responsible for a number of interesting researches on multiple personalities. Later on Freud formulated his theory of the unconscious which has done so much to illuminate the psychopathology

of the hidden depths of the unconscious. The remaining chapters deal respectively with work of Adler Jung, and Kretschmer. This is a good book which will be of interest to psychiatrists old and young.

The new *Medical and Dental Students Register* published for the General Medical Council by Constable and Co Ltd (price 7s 6d), gives the usual official information, with lists of medical and dental students registered during the year 1936, the totals being respectively 2,544 and 356.

Preparations and Appliances

THE AURAPHONE HEARING AID

A very neat and serviceable looking hearing aid has been brought out by Auraphone Limited (120 Wigmore Street W 1). To mention its external advantages first it weighs no more than two pounds with its batteries in place and in its bakelite container slips easily into the pocket or handbag. The running costs even if the instrument is used continuously for eight or ten hours a day amount to no more than ninepence or a shilling a week. More important than appearance however is the function of a hearing aid. The valve amplifying principle which has wrought a minor revolution in hearing aids giving greater freedom from distortion and improving hearing at a distance is embodied in the Auraphone instrument. Two valves are employed actuated by a dry high tension battery and a small low tension accumulator. It is possible to increase amplification at any desired part of the scale and the control of tone is easily adjusted. For the microphone a range of six different interchangeable types has been provided accentuating the very low and the very high notes with the alternatives in between. There is also a medium type possessing an equal range of amplification over the whole scale. The standard earpiece is light and neat in construction, and a midge earphone may also be provided of the diameter of a sixpence to fit the ear comfortably. The provision of aid for the deaf is much more than a mere question of amplification of all sounds it calls for selection and delicate control. Hardness of hearing is a condition of infinite variety and no instrument can fit every case but the Auraphone seems to have found a wide acceptance and is evidently the product of much careful thought both in respect to carriage and wear and also to the physics of sound conduction. The price is sixteen guineas.

HEARING AIDS AMPLIVOX MODEL

We have had the opportunity of inspecting the latest addition to the range of hearing aids by Amplivox Limited (106 George Street Portman Square W 1). This is known as the Amplivox model C and consists of a portable box which might very well be passed off (as many people are sensitive about using a hearing aid) as a small camera with the usual attachments. Its outstanding feature is the incorporation of a piezo-electric microphone ensuring good fidelity of sound reproduction and freedom from background noise which is so disadvantageous in many types of instrument and sometimes intolerable to the deaf. Three stages of valve amplification are provided. The batteries are of generous capacity for so small an instrument and last for five or six months and the accumulator can be used for 30 or 40 hours before recharging so that the cost of upkeep is a trifle. The sound intensity can be adjusted at will by means of a continuously variable volume control with an on off switch making the instrument very easy to use. An earphone of the disk type is provided also a small orifice fitting tube but the former is recommended for the best results. It is stated that the instrument has been found very successful in otosclerosis and senile deafness. It is designed for distance hearing as well as close conversation and we foresee the time when persons whose hearing is normal may make use of such instruments to overcome disadvantageous placing in public halls or places where acoustics are unfavourable. It was only from the point of view of normal hearing that we could try the instrument but in respect of volume and lack of distortion as well as absence of background noise it is wholly satisfactory. Model C is priced at eighteen guineas and the firm offers home trial before and a year's guarantee after purchase.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY APRIL 10 1937

THE NATIONAL DIET

The Advisory Committee on Nutrition appointed in May 1935 by the Minister of Health and the Secretary of State for Scotland has issued its first report and a descriptive account appears at page 771. The committee was asked "to inquire into the facts, quantitative and qualitative in relation to the diet of the people, and to report as to any changes therein which appear desirable in the light of modern advances in the knowledge of nutrition." The members of the committee addressed themselves particularly to three questions: (1) Is there sufficient food produced in or imported into the country to ensure for everyone a diet in conformity with the principles of modern knowledge? (2) Are the diets of different sections of the population adequate in every respect in the light of recent advances in the knowledge of nutrition? (3) Is the state of nutrition of every section as good as it could be made by the application of modern knowledge? The committee interpreted the term "state of nutrition" as applying to the physical and functional bodily condition only in so far as it is dependent on food.

The present report is mainly an account of the activities of the committee in attempting to answer these questions. These activities involved a comprehensive survey of the food supplies, diets, and state of nutrition of the population on a scale not hitherto attempted in this or any other country. The answers to the above questions are therefore of the first importance. It is with these answers that we are here concerned—the more so as in each case the answer is "No." The committee finds that the food produced in and imported into the country is sufficient to ensure for everyone an adequate supply of energy-yielding substances—starches, sugars and fats. It is sufficient also to ensure an adequate supply of protein. All, except a relatively small fraction of the population are obtaining the full amount of calories they require. There is no aggregate deficiency of fat in the national dietary but there is some deficiency of it in the diet of the very poorest. Consideration of the national food supply revealed no shortage of total protein but it is probable that there is some shortage of this constituent in the diet of the poorest section of the community. It appears

therefore, that although the national diet contains enough energy-giving foods—indeed enough and to spare—they are not distributed evenly among the people. The national diet is, however, deficient in certain 'protective foods' particularly milk, eggs, and green leaf vegetables. The average consumption of milk per head is only about half what it ought to be, while the national consumption of fruit and vegetables is very probably below the requirements for normal nutrition. Here again these deficiencies in the national diet are predominantly to be found in the poorer sections of the population and the problem of the more even distribution of foodstuffs forces itself insistently on our notice. We are faced then with the situation that while the national diet contains enough fuel for the bodily mechanism it does not contain enough of certain protective substances needed for the proper construction of that mechanism for the prevention of its deterioration and for the maintenance of its resistance against infection—in short for the prevention of disease.

The answer to the second question is to be found in the concluding sentence of paragraph 20 of the report: "Many of the public health measures which have been adopted in recent years such as the provision of milk for mothers and children are in themselves an admission that the home diets of some sections of the people fall short of the requirements which are essential for health." This answer was, for economic and other reasons to be expected. Indeed it arises out of the answer to the first question and involves the problem—a problem that must be faced—of the more equal distribution of food. There can be no question that while many have more food than they need many have less. The report provides no definite answer to the third question for the reason that the committee found no reliable method of assessing the state of nutrition as determined by food. But its attitude to this is revealed by certain statements made in the report. If the diet is unsuitable [and the committee says that in some sections of the people it is unsuitable] the body cannot be properly constructed neither can it function efficiently.

We believe that better physique and health can be obtained and resistance to disease increased by the application to human diet of recent knowledge which demonstrates the importance of certain classes of food for proper nutrition. Finally the inclusion of adequate quantities of the protective foods in the diet will ensure correct nutrition since given adequate resources most people instinctively consume sufficient of the energy-giving foods. Exception may be taken to the last of these statements on the

grounds that the function of nutrition depends on other factors besides food. But paragraph 13 of the report makes it clear that while the importance of these other factors is recognized their consideration is outside the scope of the committee's inquiry. Nevertheless the inclusion in this statement of some such words as that "correct nutrition will be ensured so far as food can ensure it" would have added to its value for there is the ever-present difficulty arising out of the confusion between the terms "nutrition" and "food" these terms are not synonymous.

It is clear, then, that despite their inability to assess the state of nutrition the members of the committee have little doubt that it is not "as good as it could be made by the application of modern knowledge." They affirm that "the progressive application of this knowledge and the concurrent rise in the standard of living have contributed to the general improvement in health." There is, however, much room for further improvement in the health and physique of the nation, and the more extensive application of recent discoveries in nutrition should result in new and higher levels of physical well-being. The work of the committee is far from completed, and it is perhaps for this reason that no mention is made, in the body of the report, of wholemeal bread and unmilled cereals. But general agreement with the recommendations of the Technical Commission, appointed by the League of Nations to define the nutritional needs of the human body, is recorded. The recommendations of the commission are published as an appendix to the present report. Amongst them is the following: "*White flour* in the process of milling is deprived of important nutritive elements. Its use should be decreased and partial substitution by *lightly milled cereals*, and especially by *potatoes* is recommended." We wish that this recommendation had been more wholehearted in view of the facts that whole meal flour is the staple article of diet of some of the finest races of mankind and that the important nutritive elements of which white flour is deprived in the process of milling include the vitamin B complex, vitamin E and a haemopoietic substance.

The changes in the diet of the people which in the opinion of the Advisory Committee appear desirable in the light of modern advances in the knowledge of nutrition may be summed up in the words: More protective foods, more milk, more fresh vegetables and fruit, more eggs, more potatoes. And in view of the committee's general agreement with the recommendations of the Technical Commission of the League of Nations there may be added to these changes: Less sugar, less white

flour, and more lightly milled cereals. This report, fortifying as it does the conclusions of others that have preceded it, points the way to a national food and a national health policy in conformity with "modern advances in the knowledge of nutrition," a policy which must include the greater production in this country, and the more equal distribution amongst the people, of those foodstuffs now known to be essential to health.

VACCINATION AGAINST ENTERIC FEVER

The prophylactic value of typhoid vaccine is almost universally held to be fully established but recent writings betray some uncertainty and a marked tendency to exploit new methods in the hope of achieving better results. That protection is not absolute everyone knows, but the fact that Montell¹ was able to collect 125 fully verified cases of typhoid in vaccinated individuals in the French Services is discouraging, in this series there were twenty deaths, and the author is convinced that attempted immunization, if it fails to prevent the disease, does not modify its course in any way. The recently published² statistics for the French Army and Navy though they deal with vast numbers, seem to have little meaning by far the lowest incidence of the disease is in unvaccinated individuals, though there are said to be peculiar reasons for this, and the relative merits of three types of vaccine used cannot for various reasons be safely deduced. Similar reports by Patterson and Cook³ on the effects of typhoid prophylaxis in the United States Army and Navy contain less statement of detail, and simply adduce a diminished frequency of the disease in the past twenty-five years as evidence of the efficacy of vaccination. That the incidence of typhoid among American troops in the European war and in the Spanish American war was as 1 is to 382 is no doubt a striking fact but it is capable of explanation in more than one way. Japan has a different story to tell. Kobayashi⁴ describes twelve outbreaks of typhoid in the Japanese Army often with a high case rate in one garrison for example, there were 104 men all of whom had had vaccine either ten or three months previously and among these there occurred forty-one cases of typhoid with nine deaths. On the other hand according to Ramsey immediate vaccination of household contacts lowers the expected frequency of secondary cases by three quarters. A resolution calling for the compulsory application of this safeguard was recently passed.

Muscl med 1935 62 49 97

Kobayashi Arch. exper. Med. 19 12, 1
Amer. J. Hyg. 1935 21 64

by the French Academy of Medicine. At the same meeting of the Académie Tanon, Rochoix and Cambessedes also brought forward evidence of a familiar type pointing to the efficacy of vaccination. Since the war when most men of military age were given vaccine the proportion of males of such age to females attacked has shown a diminution according to several reports, and in the recent Paris and Lyons epidemics referred to by these authors the incidence in males fell steeply after the age of 20, presumably in consequence of immunization during military service while that in females rose until the age of 30.

Such are the rather conflicting accounts of the effects of vaccination by the orthodox subcutaneous route. Its best known rival is the oral vaccine of Besredka and in this connexion it is disappointing to find that in the French Services only those men are given this vaccine "in whom any severe reaction would be dangerous." Thus no more than a few thousands have had it apparently with results not differing greatly from those of subcutaneous vaccination. A large scale trial of this method in Japan is reported by Abé who gave oral vaccine to 32,120 persons, of whom five suffered from typhoid in the ensuing six months, whereas there were forty cases among 45,790 untreated persons in the same families. Tehernozoubov on the other hand working in the neighbourhood of Zagreb has convinced himself of the value of oral vaccination against dysentery but doubts its value for enteric and offers the plausible explanation that dysentery, unlike typhoid, is a purely local infection for which local immunization would therefore be expected to succeed. Meanwhile it is being seriously suggested by E. Valentine, W. H. Park, K. G. Falk and G. McGuire that typhoid vaccine should be simply rubbed into the skin in an ointment or vanishing cream a proceeding which incredible as it may seem does cause agglutinin formation. Spassky and Danenfeld¹⁰ report favourably on a formalized vaccine (anavaccine) which has been administered to 400,000 people in Leningrad. This is said to cause milder reactions than a heat killed vaccine and experimentally gives at least as good antibody production. Perhaps the strangest procedure of all is that recommended by Suzuki and Sujco¹¹ who claim that a high degree of protection against infection by the typhoid bacillus can be achieved by oral vaccination with *Bact. pullorum* a micro-organism which causes an enteritis in fowls but is non-pathogenic for man.

Since its O antigen is identical with that of *Bact. typhosum* this is not as unreasonable as it sounds.

The chief conclusion to be drawn from this literature as a whole is that in dealing with a disease of varying but unpredictable and generally low incidence, genuine evidence of the efficacy of any method of prophylaxis is very difficult to secure. The probability is that all these methods are useful and it may be that where ordinary subcutaneous vaccination most signally fails either the individuals attacked were exposed to exceptionally heavy infection or the strains used in making the vaccine were unsuitable. In spite of all that has been written on the considerations which should govern the choice of strains for this purpose nearly all these reports ignore this aspect entirely and leave the reader to suppose that vaccine is just vaccine, the same the world over. How the efficacy of the newer methods is really to be determined on an adequate scale it is difficult to see, but no doubt they will achieve a good deal of popularity from the mere fact that they obviate the employment of a syringe and the discomfort which often follows its use.

THE FUTURE OF OUR POPULATION

We have received from the honorary secretary of the Population Investigation Committee Dr C. P. Blacker a very clearly written pamphlet¹ the work of Dr Blacker and Mr D. V. Glass setting out the salient features of the demographic position. There is no need to summarize the contents for they necessarily agree closely with those of the many other books and papers which have been noticed in our columns. But the proposals for further investigation by the committee raise a question which is of topical interest.

The Population Investigation Committee has a membership comprising representatives of various important bodies and includes individuals of scientific and professional distinction. It is however a private organization. Recently the *Times* has given much prominence to letters advocating the appointment of a Royal Commission apparently to undertake *inter alia* the work which the Population Investigation Committee desires to do. This raises the question which machinery is the more efficient? The *prima facie* appeal of a Royal Commission is great. It would have more prestige, it could at least in theory command the services of all the experts of the permanent Civil Service, its findings would receive wider publicity. A non-official committee even if it received liberal finan-

cial aid could not secure of right the co-operation of the Civil Service, and its findings, unless congruent with the views of newspaper proprietors, might secure very little publicity. On the other hand the prestige of a Royal Commission has its disadvantages. We need not be very far gone on the path of genial cynicism respecting public appointments which Mr. Hilaire Belloc and the late G. K. Chesterton followed to recognize that a Royal Commission is sure to include a number of eminent persons chosen simply because they are eminent or which is worse, because they are representative of this or that interest or this or that theory. So far as scientific investigation is concerned these commissioners are passengers or even luggage. But people will not give time and trouble to an unofficial inquiry, an association with which confers no prestige unless they really are interested.

It is difficult to say which method of approach should be preferred. If it is thought that further scientific investigation of the factors of decreasing population is the most serious need of the time then we believe that the non-official method is the one that should be chosen. If it is thought that the present basis of knowledge is sufficient to justify or indeed force the National Government to undertake propaganda or measures of reform something more imposing than an unofficial group of scientific workers is needed. Whether on that hypothesis even a Royal Commission is imposing enough may be doubted. After all Royal Commissions have sometimes been mere expedients for the side tracking of politically dangerous questions. These are it may be suggested matters which the medical profession should consider carefully. All we can say with complete confidence is that the committee's pamphlet is a clear, competent and impartial summary of the relevant facts.

INFLUENZA PROPHYLAXIS

Recent papers dealing with the question of active immunization against the virus of influenza have focused attention on this important aspect of the influenza problem. Before the work of Smith, Andrews and Lindholm in 1933 which showed unequivocally that the prime cause of influenza was a filterable virus prophylactic vaccines in use against influenza were made from those cultivable bacteria associated with the disease. Few believed that these micro organisms played anything but a secondary part in influenza and the most that could be hoped from the use of such vaccines was reduction in the number of those complications for which secondary invaders were responsible. The results obtained were unconvincing but with the discovery of the true cause of

influenza the problem can be attacked again with renewed hope. In the ferret the experimental disease leaves behind it an immunity which lasts but a few months the same would appear to be true of the natural disease in man. Smith and his co-workers have shown that this waning immunity in the ferret can be restored by the subcutaneous inoculation of virus, a method of inoculation which does not give rise to infection in the fully susceptible animal. Most people possess neutralizing antibody as the result of previous conflict with influenza virus, the mechanism of immunity has been established in them, would it not therefore be possible to reinforce this basic immunity by the injection of a virus vaccine and so protect individuals at the time of epidemics? This is the problem which those working with influenza virus have attempted to answer. Francis and Magill have tried to do this by injecting living virus subcutaneously or intradermally. Their experiments were conducted on a series of twenty-two human volunteers and their criterion of immunity was an increase in the neutralizing power of the blood of these individuals. Their results showed that a titre of antibody equalling that produced by an attack of influenza could be obtained with regularity by this means that the antibodies persisted for at least five months and that the method of inoculation was without apparent danger. Andrews and Wilson Smith, as the result of preliminary work on mice chose to use a formalized virus vaccine in their attempts to immunize man. This choice was dictated by the fear that the employment of live virus in mass prophylaxis might prove dangerous and also because the experiments on mice suggested that virus given by a non-infecting route was equally effective as an immunizing agent whether it were alive or not. Their human experiments though fewer in number than those of Francis and Magill showed that inactive influenza virus injected subcutaneously evoked a good antibody response. In these experiments Andrews and Smith used a mouse lung virus, whereas the vaccine of Francis and Magill was prepared from virus grown in tissue culture. Burnet proposes yet another vaccine. He has demonstrated that egg grown virus loses its infectivity for the ferret and yet when administered by the nasal route gives rise to immunity. He suggests that such a virus might be sprayed into the nose and throat as a prophylactic measure in man. Promising though all this work may be it should be borne in mind that these measures have yet to be submitted to the crucial test of their efficacy in the field.

VOCATIONAL GUIDANCE AT BORSTAL

An important factor in the reform of a delinquent is his re-education in new habits of thought and action. The authorities of Borstal institutions seek to inculcate habits of industry, self-respect and self-control in young offenders and one of their chief instruments is the work party. They claim that if they can teach a boy to believe that he can do a good job of work

Brit. J. exp. Path. 1935 16 211
J. exp. Med. 1937 65 251
Brit. J. exp. Path. 1937 18 37

they will have done much to prepare him to receive the other important influences which they attempt to foster. A boy who is vocationally efficient tends to be generally contented. In order to improve the vocational efficiency of Borstal boys the National Institute of Industrial Psychology made a preliminary experiment about ten years ago to discover to what extent psychological tests by simplifying the problem of allocating boys to the most suitable working parties would make for contentment and stability in their work. The results were so promising that a second and larger experiment was carried out by the National Institute at the expense of the Medical Research Council. The report on this work¹ by Mr Alec Rodger suggests strongly that vocational guidance properly applied is of great help in placing boys in the right kinds of work and ought to be adopted as a routine method in any scheme of reform by industrial education. Four hundred boys were tested at the beginning of their period of detention. Recommendations were made for all of them but these were forwarded to the institutions in alternate cases only, the controls being allocated to work parties by the house masters. A hundred and ten of the recommended group of 158 became Grade A workers but only seventy-three of the control group of 160 became Grade A workers. The difference shows clearly that with the aid of the new procedure the house masters could achieve better results than they can without it. As Mr Rodger points out the proved value of the experiment represents only a minimum of its potential value and if trained advisers worked at the institutions the results would be even better. The Prison Commissioners have arranged on the advice of the Departmental Committee on the Employment of Prisoners that house masters and assistant house masters should be trained in the technique of vocational advice. Mr Rodger recommends that more boys should be employed on skilled work and should also have some opportunity of advancing in technical knowledge and that incentive should be increased by payment and the granting of certificates. Definite provision should be made for training in clerical duties and in work such as salesmanship which calls primarily for good social qualities. He suggests that further investigation should be carried out to discover whether more precise tests could be devised and to improve the study of temperamental differences.

SHIGA AND DYSENTERY

It is now almost forty years since Shiga identified the micro-organism which goes by his name and thus initiated the study of dysentery bacilli. Few of the great pioneers of that era are still living and it is thus of unusual interest to read a lecture by Shiga himself delivered at the Harvard Tercentenary Conference last September in which he surveys the consequences of his discovery. There has of course been an enormous reduction in the frequency of dysentery in Japan during

this century which must be largely the result of preventive measures based on bacteriological methods in particular the detection of carriers. Nevertheless Shiga appears to feel that the work to which he has devoted his life has not reached its goal and in so far as this is really true it means only that a perfect method of preventive immunization has not been found. That killed dysentery bacilli form a very unpleasant vaccine. Shiga proved in his own person in this lecture he actually says of a memory now very old that he was "frightened" by the reactions produced. Whether treatment with formalin or fractionation will overcome this difficulty without loss of immunizing power seems yet to be unknown. So far as present methods are concerned the most important question is whether oral vaccines on the Besredka model are really effective or not. Shiga records that these have been given to hundreds of thousands of persons in Japan but he appears unwilling to accept the results as favourable though he is evidently open to conviction that the method has possibilities. Nor does he appear to place faith in bacteriophage. If as Shiga hopes a better method of immunization is yet to be found we heartily wish him long life in which to see it arrive.

VASCULAR CHANGES IN HEMIPLEGIA

Kerr and Underwood¹ have recently described an unusual case of hemiplegia associated with vascular obliteration in the paralysed extremities. The patient a male clerk developed at the age of 23 a motor aphasia and right hemiplegia of gradual onset after a drinking bout. A year later though the aphasia and paralysis had partially recovered he observed that his right side was cooler than his left and that the pulse at his right wrist was feeble and sometimes could not be felt. At that time he began to suffer from Jacksonian convulsions beginning in the right arm and followed by a generalized fit and unconsciousness. These attacks continued till 1934 when at the age of 33 he was first seen by the authors. He was found to have some residual motor aphasia with a slight spastic paralysis of the right upper and lower limbs and a positive Babinski's sign on the right. The right upper and lower limbs were cooler and drier than the left and there was slight oedema of the right ankle. The most peculiar feature of the case was that the right brachial and radial pulsations were barely palpable and the right popliteal dorsalis pedis and anterior tibial arteries impalpable even after warming the limbs. These pulsations in the unaffected limbs were normal. The systolic and diastolic pressures were 130 and 110 mm Hg respectively. During two years of observation the patient's condition remained essentially unchanged but he presented from time to time thrombophlebitis of the superficial veins of the right lower extremity. Special examinations confirmed the diagnosis of obliterative arterial disease of the right upper and lower limbs and encephalography showed some atrophy of the left cerebral hemisphere. It is probable as the authors suggest that the hemiplegia

¹ *Lancet* Excerpta Medica, 1936, 215, 1255. By Allen L. Kerr and H. M. S. Underwood.

was due to a cerebral thrombosis. They suppose, first that this lesion interfered with the function of the premotor cortex which according to Fulton and his co-worker Kennard¹ leads to vasoconstriction in the opposite extremities and finally that "possibly the profound vasomotor imbalance incident to his hemiplegia hastened the evolution of an occlusive arterial disease." The case raises two chief questions: first, What is the cause of the diminished blood flow which is usual in the paralysed extremities in hemiplegia? and secondly, Does diminished blood flow favour arterial thrombosis? To the first question no final answer is possible for as Lewis and Pickering² have recently pointed out diminished blood flow through the affected extremity is common to all forms of motor paralysis in man. The second question was answered in the affirmative many years ago by Toma and in a subject who initially had vascular disease as judged by an apparent cerebral thrombosis, a raised blood pressure and thickened vessels in the unparalysed limbs it does not seem unreasonable to suppose that clotting in the arteries of the weakened extremities was hastened by the slow blood flow through them.

VETERINARY EDUCATION

The Special Educational Number of the *Veterinary Journal* (March 1937) states that the prospects in this profession are excellent at the present time and that there is no expectation of overcrowding for another ten years. There is indeed an insufficiency of graduates to meet the immediate demands of private practice of county, State and municipal bodies at home and of the Colonial Services. Colonel G. K. Walker writing on veterinary education regards the Report of the Conference on the Medical Curriculum, published in 1935 as of outstanding importance to the veterinary profession for the educational problems involved are to a considerable extent analogous. The report stresses very strongly the desirability of introducing the student during the last two terms of the pre-clinical period to the elements of pathology, immunology and bacteriology. This recommendation applies with equal or even greater force to the veterinary curriculum for veterinary hygiene is taken during this period. Nevertheless since the pre-clinical veterinary student is already burdened with the last-named subject and with animal management in addition to the studies analogous to those prescribed for medical students during the same period the inclusion of further subjects in the already crowded curriculum is a matter of some difficulty. It is suggested that the dropping of the examination in pharmacology would provide a partial solution of the problem. It appears that at some future time it will be necessary to extend the course of the veterinary curriculum from four to five years. Three years would then be available for the clinical period. It must be remembered however that under present conditions a minimum period of six months extra mural clinical instruction is required in addition to the work in hospital.

The Educational Number includes excellent practical articles on equine practice, poultry practice and the veterinary aspects of milk production and bacon factories. Other articles are devoted to Government and private practice in Australia and veterinary education in Canada. In an illuminating commentary on the milk industry Mr. P. B. Tustin details the simple procedure necessary for clean milk production showing that this is not an intricate scientific problem, and that expensive stabling and equipment are not required. The author deplores the fact that there are still veterinary surgeons to be found who advocate the consumption of raw milk despite the fact that Minett and Pullinger after an examination of sixty-five certified and Grade A (T.T.) herds found that 73½ per cent contained *Br. abortus* and 63½ per cent haemolytic mastitis streptococcus. A list of eight milk-borne epidemics during a period of eight years taken from the Ministry of Health reports includes outbreaks of 183 cases of scarlet fever with 3 deaths at Doncaster in 1936 and of 500 cases of typhoid with 47 deaths at Bournemouth in the same year, of 1 600 cases of paratyphoid with 6 deaths at Chelmsford in 1935 and of 1 200 cases of septic sore-throat (streptococcal) with 65 deaths at Hove in 1929. Altogether the eight epidemics mentioned were responsible for 3 766 cases of illness with 125 deaths. It is noted that the farms to which the sources of these outbreaks were traced were producers of the highest grades of milk. Mr. Tustin points out that no epidemics have been reported where milk is properly pasteurized. In America not only the veterinary and medical professions but also the largest organizations of milk producers are strong advocates of pasteurization.

TRAVELLING MEDICAL FELLOWSHIPS

The Medical Research Council announces that it has been entrusted by the Rockefeller Foundation of New York with £3 000 annually for three years in the first instance for the award of Travelling Fellowships in Medicine to candidates in the United Kingdom. This generous benefaction renews an arrangement which had been highly successful during an earlier period but which had latterly been interrupted during a revision of the Foundation's general policy. These Rockefeller Fellowships are intended for graduates who have had some training in research work in clinical medicine or surgery or in some other branch of medical science and are likely to profit by a period of work at a chosen centre in the United States or elsewhere abroad before taking up positions for higher teaching or research in this country. Five or six Fellowships will be available annually and applications for the academic year 1937-8 will be invited in May. It is of interest to recall an analysis which was made at the end of the previous ten year period of the positions occupied by the seventy men and women who had completed their tenure of Rockefeller Fellowships awarded by the Council. This showed that twelve were professors in universities, that thirty-six others occupied whole time positions for teaching and research and that a further sixteen held part time appointments of the same kind.

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

HORMONES IN THE TREATMENT OF MENSTRUAL DISTURBANCES

By

P. M. F. BISHOP, B.M., B.Ch.

The causes of menstrual disturbances may be organic, nervous or endocrine. General debilitating conditions such as anaemia, tuberculosis and wasting diseases commonly give rise to amenorrhoea. Local lesions of the uterine mucosa or muscle such as chronic endometritis, polyps, fibroids and malignant new growths may result in excessive uterine haemorrhage. Such organic causes should be excluded before endocrine therapy is considered.

Emotional disturbance, a sudden shock or a change of environment may lead to amenorrhoea and it has been suggested that such stimuli may induce a flow of inhibitory impulses from the hypothalamic nuclei checking the gonadotropic secretions of the anterior pituitary which control the ovarian and hence the uterine cycle. In such cases the inhibitory influence on the pituitary may be removed as suddenly as it was applied with re-establishment of the menstrual rhythm. Should this occur while the patient is receiving hormone treatment the endocrinologist may claim a success to which he is not entitled for it is not generally conceded that the hypothalamic nuclei are affected by the therapeutic administration of pituitary or ovarian extracts.

The menstrual cycle is disturbed in such glandular syndromes as Graves' disease and myxoedema, Simmonds' disease, acromegaly, pituitary basophilism and the adreno-genital syndrome but treatment of the general endocrine disorder rather than of the menstrual derangement is indicated.

Finally the alteration of menstrual function may be the only sign of hormone deficiency and it is with the treatment of such cases that this article is concerned.

Uterine Bleeding in Menstrual Disorders

If a course of large doses of oestrin the ovarian follicular hormone is administered to a castrated woman uterine haemorrhage will take place from one to two weeks after the last injection. This is known as oestrin withdrawal bleeding. If smaller doses are given intermittently haemorrhage may arise during the course of treatment. Such haemorrhage is due to the effect of oestrin on the endometrium being maintained at the level or threshold at which bleeding occurs. This may be described as threshold bleeding. Oestrin withdrawal bleeding therefore supervenes when the oestrin effect on the endometrium is withdrawn from a super-threshold level.

This excretion would account for the high concentration of oestrin in the blood and in the urine which is found during the second half of the menstrual cycle—a time at which there is evidence of a comparatively low oestrin effect. Oestrin-withdrawal bleeding does not however take place for in the meantime progesterone has been exerting its own specific effect on the endometrium converting it into the premenstrual type. As the corpus luteum wanes the endometrium is deprived of all hormonal sustenance and begins to be shed on the twenty-eighth day of the cycle—menstrual bleeding.

Whether menstruation occurs regularly, not at all or irregularly and excessively depends therefore on the effect of oestrin on the uterus and the subsequent presence or absence of progesterone. Amenorrhoea is usually due to a sub-threshold effect of oestrin on the uterus. The endometrium fails to reach that stage of development which must be attained before bleeding can be induced. Menorrhagia and metrorrhagia supervene when oestrin reaches and is maintained at the threshold or bleeding level. Since ovulation fails to take place and no corpus luteum is formed this constant effect of oestrin continues unopposed owing to the absence of progesterone.

Amenorrhoea, Hypomenorrhoea, Oligomenorrhoea

OVARIAN REPLACEMENT THERAPY

The sub-threshold effect on the uterus in amenorrhoea, hypomenorrhoea (scanty flow) and oligomenorrhoea (prolongation of interval) may be due to inadequate secretion of oestrin (ovarian deficiency) to failure of the uterus to react to normal quantities of oestrin (uterine deficiency) or to a combination of the two. The uterus is usually small and the endometrium atrophied.

The first stage of treatment therefore is to build up the uterus to adult size which in itself may result in rendering the endometrium more sensitive to ovarian stimulation. This may be accomplished by the administration of some compound of oestrin (ovarian replacement therapy). 50,000 I.B.U.* of a reliable preparation of oestradiol† (the hormone actually secreted by the ovarian follicle) are injected intramuscularly at intervals of three to four days until five doses have been given. This course of 250,000 I.B.U. which probably represents an unnecessarily high dose should induce an oestrin withdrawal haemorrhage ten to fifteen days after the last injection. A second course of injections should begin immediately bleeding occurs. In the absence of a haemorrhagic response an interval of three weeks should separate the two courses.

Progesterone inactivates oestrin which is therefore more effective during the first than the second half of the menstrual cycle in cases of hypomenorrhoea. Even in

the appearance of the vaginal smear. Accurate information as to the uterine growth response can be obtained only by measurement of the intra uterine length with a metal sound. The most convenient criterion of response is uterine bleeding. In cases of long standing amenorrhoea this is produced only if relatively high doses are administered. Usually three or four courses are required to induce or restore uterine function.

If the amenorrhoea is due to uterine insensitiveness alone such replacement therapy may induce the uterus to respond to the natural secretions of the ovaries and the menstrual rhythm may be restored without further treatment.

OVARIAN STIMULATION THERAPY

If the uterine hypoplasia results not from a primary failure of uterine development but from defective ovarian activity this must now be dealt with. It may be due to an inadequate pituitary stimulus or to a failure of the ovary to respond to normal amounts of pituitary secretion.

The second stage of treatment consists, therefore in prescribing gonadotropic extracts (ovarian stimulation therapy) 100 to 500 R U* of a gonadotropic extract of pregnancy urine† are injected intramuscularly three times a week for four weeks. This course may be repeated. Treatment should then be discontinued for a month, after which it may be resumed if there is no re-establishment of spontaneous menstrual rhythm.

Theoretical considerations would indicate that the ideal form of treatment is the administration of a follicle-stimulating hormone (prolan A) for a fortnight, followed by the luteinizing hormone (prolan B) during the second fortnight. Unfortunately clinically effective follicle stimulating extracts are not yet obtainable commercially and consequently only luteinizing extracts are used. Available experimental evidence would indicate that the adequate dose for the human female is probably higher than now employed.

Estimation of Oestrin and Prolan

Estimations of oestrin and prolan in the blood and in the urine are considered by some authorities to be useful in determining the nature of the disturbance of hormone secretion. It is found however, by most workers in this country who are familiar with such technique that the methods of hormone assay of body fluids at present in use are not sufficiently accurate to provide valuable information. Furthermore the finding of an excess or deficiency of any particular hormone in blood or in urine does not necessarily indicate a corresponding excess or deficiency of secretion or utilization of that hormone in the organism.

The results of hormone therapy in this group of cases are disappointing. Menstrual cycles are very seldom established in cases of primary amenorrhoea (women over the age of 18 who have never menstruated). Permanent re-establishment of menses occurs in 10 to 20 per cent of cases of secondary amenorrhoea and in cases of oligomenorrhoea and hypomenorrhoea regularity and normal loss are achieved and maintained in 30 to 40 per cent. Such results are not surprising when the intricacies of the problem are considered. The delicate interrelations between pituitary, ovary and uterus are difficult to re-adjust by the use of hormone extracts of which the optimum dose is not known. The reasons for applying a particular hormone at a certain phase of the cycle are

* Gonadotropic hormones have not yet been obtained in crystal line or synthetic form and are therefore assayed biologically in rat units (R U) instead of international or weight units.

† Pregnyl (Organon), Anlutrin S (Parke Davis), Prolan (Bayer), Goran (British Drug Houses). Such extracts contain mainly prolan B the luteinizing hormone.

at present based chiefly on hypothetical conjecture. Even the nature of the extract is not in some cases, the most suitable—for example the use only of luteinizing extracts for ovarian stimulation, which probably requires a carefully adjusted combination of follicle stimulating and luteinizing hormone.

Menorrhagia and Metrorrhagia

This type of menstrual disturbance will be considered under three headings: menopausal, maturity and puberty bleeding, for the treatment differs according to the age of the patient.

MENOPAUSAL BLEEDING

The activity of the ovary is waning. It is becoming insensitive to the gonadotropic stimuli of the pituitary, even though these are now relatively excessive. Oestrin is reaching no longer super threshold but threshold or bleeding levels. Progesterin, if secreted at all is ineffective in lowering such levels. Attempts to prolong the life of the ovary by artificial stimulation with gonadotropic extracts are illogical. Treatment should be designed to hasten the death of the ovary by destructive doses of deep x rays or of radium, or to remove the source of the haemorrhage by hysterectomy.

MATURITY BLEEDING (METROPATHIA HAEMORRHAGICA)

Ovulation fails to take place and the ovaries may be palpably enlarged and are studded with small cystic follicles which have not ruptured. The endometrium is submitted to continuous stimulation by oestrin, and an exaggeration of the proliferative phase ('Swiss cheese' or glandular hyperplasia) results in thickening and sometimes polyposis. The menstrual rhythm is disturbed and periods of profuse flooding or mild but continuous haemorrhage alternate with amenorrhoea. During the bleeding phase oestrin is presumably being maintained at threshold levels in the absence of progesterin. During the phases of amenorrhoea oestrin has either failed to reach the threshold level or continues to be above it.

The treatment during a bleeding phase is to administer progesterin or a luteinizing gonadotropic extract 1 Rab U* of progesterin or 500 R U of a gonadotropic extract or both should be given by intramuscular injection daily until the haemorrhage ceases. Such treatment usually succeeds in arresting the flow within three or four days. To re-establish the normal rhythm is more difficult, but an attempt may be made to do so by applying a continuous luteinizing stimulus such as 100 R U of a pregnancy urine extract three times a week for a month. Such a course may be repeated as indicated in the section on amenorrhoea.

PUBERTY BLEEDING

The cause of this type of bleeding is not completely understood but it is probably due to defective function of the corpus luteum. The menstrual rhythm is usually undisturbed and the condition is one of pure menorrhagia though sometimes the menstrual cycle is shortened to three weeks.

Treatment consists in increasing the luteinizing stimulus 100 R U of a gonadotropic extract are injected intramuscularly three times a week for four weeks. The course may be repeated as indicated in the section on

* Progesterin has recently been synthesized. One IU (international unit) = 1 mg of synthetic progesterone. At present the synthetic product is not generally available commercially and natural progesterin extracted from the corpora lutea of ovariectomized pigs is used in rabbit units (Rab U).

† Progesterin (Organon) 1 Rab U = 1 IU. Prolan (S. Bayer) and Progesterin (British Drug Houses) available in international units. Lilex Leo (distributed by Beecham) 1 Rab U = 1 IU.

amenorrhoea The results of treatment are highly satisfactory and normal flow is usually established within three or four months. It is important to deal with this condition early as it frequently leads to amenorrhoea or maturity bleeding if left untreated.

Dysmenorrhoea

When extrinsic causes of dysmenorrhoea such as fibroid polyps, the passage of clots or pieces of membrane or uterine congestion from pelvic inflammation have been excluded, there remain three factors—nervous, psychological, and endocrine—the relative responsibility of which it is difficult to assess.

There is evidence to show that in a high proportion of cases of spasmodic dysmenorrhoea the pain is due to an inflammatory or irritative lesion of the sympathetic nerves supplying the uterus. In these cases hormone therapy is obviously of no value and the condition should be dealt with by cervical dilatation, alcohol injection of the pelvic plexus or pre-sacral sympathectomy. The psychological element may predominate not only in the obviously hyperaesthetic but also in the apparently "thoroughly sensible" type of woman, and the best way of determining how far it is responsible for the pain is by the administration of dummy tablets of oestrin (tablets of which the oestrogenic potency has been previously destroyed) or by injections of sterile olive oil. It is striking how frequently this device provides complete, if only temporary relief.

The cases of endocrine origin fall into two groups, those due to deficiency of oestrin and those due to lack of progestin. Dysmenorrhoea often accompanies uterine hypoplasia. Menstruation which is usually scanty, is taking place in an organ inadequately developed for such a function. There may be lack of co-ordination between the contraction of the uterine muscle and the evacuation of the blood from the narrow os. The dysmenorrhoea may disappear if the uterine hypoplasia is corrected. This may be accomplished by the oral administration of a compound of oestrin. 1 tablet of oestrone* the strength of which varies from 1000 to 50000 IU according to the requirements of the case should be administered daily by mouth. Such comparatively small doses affect only the development of the uterine muscle and do not interfere with the menstrual rhythm. They may therefore be given continuously throughout the cycle without fear of inhibiting menstruation. If higher doses are required they may be injected intramuscularly as in the course outlined in the section on amenorrhoea.

There is evidence to suggest that progestin inhibits uterine motility. Observations obtained by introducing a balloon into the uterus and recording the uterine movements on a kymograph show that during the second half of the menstrual cycle uterine contractions are in abeyance though they begin to reappear during the pre-menstrual twenty-four to forty-eight hours and reach maximum intensity during menstruation, this period corresponding with the regression of the corpus luteum and the absence of progestin. The administration of progestin therefore alleviates the symptom in some cases of dysmenorrhoea, particularly when the pain begins a day or two before the onset of the menstrual flow and is most intense on the first day of menstruation. 1 Rab U† of progestin is administered daily commencing one or

two days before the expected onset of the menstrual flow* and continuing up to the third day of the period.

Conclusions

During the past four or five years the pendulum of opinion has swung from unreasonable scepticism to unscientific optimism and it is important to consider critically the present possibilities and limitations of endocrine therapy in menstrual disorders. The subject is still in its infancy, and it will probably take another five years for sufficient data to be collected to enable sound principles of treatment to be laid down and clinical results to be evaluated.

At present there are two main principles of treatment, replacement therapy and stimulation therapy. Replacement therapy yields comparatively good results for its purpose is simple and direct. By administering oestrin for example it is possible to induce uterine growth. By injecting progestin the level of oestrin utilization which in a case of maturity bleeding has reached and is being maintained at the bleeding threshold may be lowered and the bleeding is immediately checked. The knowledge that progestin or prolan can effectively control the sometimes alarming haemorrhage of menorrhagia should save many a young woman from the tragedy of hysterectomy or the futility of a cruetage. Replacement therapy however is only temporary in its effect. Discontinue the administration of oestrin in a case of ovarian deficiency and the uterine muscle will atrophy. The progestin which checked a bout of bleeding in a case of menorrhagia will not prevent the repetition of such a flooding.

Stimulation therapy yields comparatively poor results except in cases of puberty bleeding. Re-establishment of menstrual rhythm in a long standing case of amenorrhoea or menorrhagia demands readjustment of a delicate endocrine balance whereby the ovary is subjected to hormonal stimuli of varying nature and intensity throughout the cycle.

Finally some of the preparations in use are substances of considerable potency the remote effects of which are even yet not fully recognized. They should therefore be employed cautiously and with respect lest they cause permanent damage to the uterus, ovaries or pituitary.

The Laboratories La Biotherapie of Paris have instituted an annual Besredka prize subject to the following regulations: (1) The prize will be awarded for an original manuscript or printed work on local immunity in its therapeutic applications. (2) MSS or printed works must reach *La Biotherapie*, 5 Rue Paul Barruel, Paris 15e before December 31 of each year, either in typewritten or printed form in five copies. Printed works must not be of earlier date than November 30 of the preceding year. (3) For manuscript work anonymity is optional; in such case the MS must bear a motto reproduced on an envelope containing inside the name and address of the author. (4) The competition is open to scientists without distinction of nationality, but MSS or printed works must be presented in French. (5) The prize is of 15000 francs. If the jury decides that no one of the presented works is worth a prize the amount is to be added to that of the next year but cumulation cannot exceed the sum of 30000 francs. (6) The jury is composed of Prof. A. Ch. Achard, member of the Institute, Prof. A. L. L. of the Faculty of Medicine of Paris, and Prof. J. B. of the Faculty of Medicine of Strasbourg.

ONE HUNDRED AND FIFTH ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION BELFAST, 1937

THE one hundred and fifth Annual Meeting of the British Medical Association will be held in Belfast next summer under the Presidency of Professor R. J. Johnstone BA MB, FRCS FCOG MP, consulting surgeon, Royal Maternity Hospital, gynaecologist to the Royal Victoria Hospital, and professor of gynaecology, Queen's University, Belfast, he will deliver his address to the Association on the evening of Tuesday July 20. The Sectional Meetings for scientific and clinical work will be held on Wednesday, Thursday and Friday July 21, 22 and 23, the morning sessions being given up to discussions and the reading of papers. The Annual Representative Meeting for the transaction of medico-political business will begin on the previous Friday, July 16. The full list of officers of the seventeen Scientific Sections, the provisional programme and time-table, information about accommodation, and other details of the arrangements for the Annual Meeting will be found in this week's *Supplement*. We publish below the second of a series of articles on Belfast and its medical and scientific institutions. The first article appeared on January 30 (p. 233).

THE CITY OF BELFAST

On April 27, 1613 Belfast, then a small town, was constituted a Corporation by a charter of James I, to consist of a Sovereign or Chief Magistrate and twelve Burgesses with the right of sending two members to Parliament. This charter was annulled by James II, and a new one was issued in 1688, but the original was restored in 1690 by William III. In conformity with the passing of the Municipal Corporations Act of 1840 the constitution of the Corporation was changed and made to consist of ten Aldermen and thirty Councillors, in 1898 it was further enlarged to fifteen Aldermen and forty-five Councillors. In 1888 Belfast was given the rank of a city by Royal Charter of Queen Victoria, conferring upon the new city all the rank, liberties, privileges and immunities incident to a city. In 1892 the title of Mayor was changed to Lord Mayor, and in 1923 the style of the Right Honourable was prefixed to his official title.

Belfast is a progressive modern city. While it has the marks of a great centre of manufacturing activity—commerce and industry first gave it prominence—it would be a false conception to picture it as a mere aggregation of industrial works with screeching sirens and belching chimneys. It is a metropolis and a university city. It boasts a series of buildings of imposing magnificence and pleasing architectural features. The deposit of grime upon the stonework of its buildings is conspicuously less than in say the manufacturing centres of the English Midlands. It has happily no legacy of ancient slums and overcrowded tenements; the thoroughfares are mainly straight and broad, shops and offices which met the requirements during the past century have been replaced by elegant emporiums and suites of offices

of modern taste and design. The visitor will readily pass the hours amid the attractions of the shopping centre of this, the capital city of Northern Ireland.

One notable, indeed almost unique feature that appeals to visitors is the constant views of the circling hills from the streets, adding charm and relieving monotony. A tram or bus ride along the Antrim Road transports the passenger to Bellevue and Glengormley, where a magnificent view of Belfast Lough, the pleasant hills of Down on the opposite shore, the Copeland Islands at the entrance to the Lough, and even the distant coast of Scotland is presented in a pleasing prospect. Or a trip to Ligoniel will yield a commanding panorama of the city encompassed by the hills with the opening to the south to mark the valley of the Lagan. Few cities provide such variety of scenic grandeur within a four mile radius of the hub of activity in the city centre.

This centre is at Castle Junction, through which all

trams pass close to the site of the former Belfast Castle where in resided the then Lord of the Manor, the Marquess of Donegall. Close to the landing place at Donegall Quay the visitor cannot fail to notice the Albert Memorial, a handsome clock tower 113 feet high erected to the memory of the Prince Consort in 1869. In those days the Mayor received a salary for his services—a practice long since abolished—and the then occupant (Mr. John Lytle) devoted his salary for two years to this object, the balance of the cost being raised by public

FIG. 1.—The City Hall Belfast

subscriptions. To-day the "Albert" is Belfast's time piece, and dominates High Street, Belfast's oldest thoroughfare.

The City Hall

The City Hall will attract the attention of the visitor as it occupies a commanding position at the southern

end of Donegall Place within a few hundred yards of Castle Junction. Perhaps some aesthetic critics will regret the absence of the modern severity of architectural design but most will admit that as a building the City Hall is most imposing and that as a spectacle its architectural detail is blended in a pleasing harmony of stone. Surrounded by beautiful and well kept gardens its proportions do not over-awe the neighbouring buildings or render the Hall itself insignificant. The building was erected on the site of the old White Linen Hall to the plans of Sir Brumwell Thomas at a cost of £328 000 and opened by the Marquess of Aberdeen as Lord Lieutenant of Ireland in 1906. The style of architecture is Renaissance. Portland stone being used in its construction. One side of the surrounding gardens has been adapted as the City War Memorial in the form of a Garden of Remembrance.

The façade as viewed from Donegall Place is pleasing and impressive. The lower story is used for offices and committee rooms; the upper lighted by lofty windows contains the Council Chamber and a magnificent suite of reception rooms. Above the *porte cochère* is a pediment with an allegorical group worked thereon. The massive central dome of the main building reaches 173 feet above the ground. The walls of the vestibule and entrance hall and the entire staircase are of beautifully variegated marble and there is an imposing entrance hall from which the main staircase rises a fine view of the interior of the dome being obtained from this point. Chaste stained-glass windows simple memorials to the glorious dead and to the heroes of many battles are erected in excellent taste, and make their appeal by virtue of their merit and appropriateness. The Council Chamber is furnished in oak beautifully carved and imposing in its stateliness; the reception rooms consist of a banquet hall and a Great Hall the floor of which is covered by a Donegal-woven carpet weighing five tons. The Great Hall is reserved for civic receptions, and on such occasions with the blaze from many electric lights illuminating the decorations the crowded floor gay with beautiful dresses and rich with brilliant uniforms and crimson robes and gowns the most captious critic will confess that this is indeed a noble hall of State and worthy of the municipal palace of a great city.

The Assembly Buildings

The Church House of the Presbyterian Church in Ireland in the Assembly Hall of which the Representative Body will hold its annual deliberations is a building

FIG 2—The Assembly Buildings Belfast

reminiscent of the Scottish baronial style of architecture. It is situated in Fisherwick Place within easy distance of the City Hall and city centre. It is conspicuous by its tall massive tower crowned with an arch spire similar to the steeple tower of St Giles in Edinburgh. It is easily located by its peal of bells, which chime the hours and quarters and by the electrically controlled carillon whose bells peal forth at midday and three hourly intervals by day. Within are housed the various departments of the Presbyterian Church with a minor hall, numerous committee rooms, offices, gymnasium and reading and recreation rooms. There is also a fine Assembly Hall, oval in plan with two galleries and a seating capacity of 2 300 ideal for its intended purpose of a debating chamber and hall for public lectures.

The Assembly's College, the Theological College of the Presbyterian Church is used for the training of students for the ministry. It was built in 1853 and residential chambers

have been added to the original building. It is close to Queen's University and has very kindly been granted to the Ladies Committee for use as a Ladies Club by the Principal of the College. During the construction of the

Parliamentary buildings at Stormont the College was used for the meetings of the Northern Ireland Parliament.

Fisherwick Presbyterian Church, five minutes walk from the University is to be the scene of the combined religious service with His Grace the Lord Archbishop of Armagh Primate of All Ireland, as the preacher. The various religious denominations have many beautiful edifices for the observance of public worship. Carlisle Memorial (Methodist) and St Peter's (Roman Catholic) being fine examples

FIG 3—The Assembly's College Belfast

of harmonies in architecture and appeal in their religious symbolism. St Patrick's Church in Donegall Street, where will be the celebration of High Mass is noted for its magnificent decorations and beautiful interior.

The Royal Belfast Academical Institution opened in 1810 is one of the oldest secondary schools in Belfast and is famous as having had many notable scholars on its

roll, many of whom have distinguished themselves in the worlds of science, letters and art, among them Lord Kelvin whose father was one of the teachers, and who was born in one of the houses directly opposite and Viscount Bryce. It is an impressive building now partially concealed by the College of Technology which is a modern structure in the Renaissance style. The latter is maintained by the municipality and serves as a seat of education and training for those destined for the industries of a great city. Those interested in the process of linen manufacture who have not time or the opportunity of visiting the factories and works which specialize in the various branches of the industry could not do better than inspect the weaving-rooms on the ground floor where some forty distinct types of loom may be seen and where students are taught every process from the rough dressing of the flax to the weaving of beautiful damasks.

The Royal Courts of Justice

The Royal Courts of Justice are situated within a few minutes walk from Castle Junction. These form one of the most dignified and imposing public edifices in the United Kingdom, and Ulster owes both them and the larger Stormont Buildings to the generosity of the Parliament at Westminster. The buildings front three public roadways and occupy a site which was formerly a portion of the city markets. The style has drawn general admiration and those who spend some of their time in them will realize that the dignity and tradition of the law are nobly expressed in the centre of justice in Ulster. From the two principal entrances access is gained to the Central Court Hall from which admission to the four courts is obtained (two Kings Bench a Chancery and a Court of Appeal). Marble has been used for the decoration of the walls and floor of the Central Hall and Empire teak for the panelling of the Courts. The furnishing of the libraries is admirable, and conveys an atmosphere of restfulness and study in a sphere of erudition and knowledge. The opening ceremony was performed in 1933 by His Grace the Governor who formally handed the key of the building to the Lord Chief Justice for Northern Ireland Sir William Moore Bt.

The Ulster Hall

The Ulster Hall, in Bedford Street a short distance from the City Hall, was acquired by the Corporation some thirty five years ago. It is to serve during the Annual Meeting for the Trades Exhibition and Registration Rooms. As the visitor stands upon the platform and glances along the walls or at the lofty ceiling he might recall that the building has been the scene of many stirring political demonstrations, and that the platform upon which he rests has resounded on many occasions to the measured pacing of the lions of the British political arena and that the walls have echoed the pleadings, exhortations, denouncements and encouragements of Lord Salisbury, A. J. Balfour, Bonar Law, Sir Edward Carson, and Lloyd George, among many others.

The Museum and Art Gallery

The Royal Botanic Gardens close to the University contain the City Museum and Art Gallery, the present building being but the first stage of a more comprehensive scheme. In it are contained unique collections of Irish spinning-wheels and of bicycles together with examples of Irish arts-and crafts of cut glass work, ceramics and textiles, and relics of ancient Irish life in the form of archaeological specimens and other antiquities. The series of views of Old Belfast (forming part of the McGowan collection) will fascinate students of the city's history and many will be interested in the portraits of thirteen of America's Presidents who were of Ulster descent. One of the special attractions in the Art Gallery is the donation of Sir John Lavery R.A. of a representative collection of his works to the city of his birth. The genius of prominent Ulster artists—Conor, Henry, Craig, McKelvey, Carey and Gordon—is reflected in what promises to be a magnificent collection representative of fine art.

St. Anne's Cathedral

The cathedral built upon the site of the old parish

Fig 4—Parliamentary Buildings Stormont

church of St. Anne in Donegall Street unfortunately finds itself for the time being shut in in an area which is only beginning to undergo modernization in its building and development. The site and church were the gift of the fifth Earl of Donegall but the cathedral dates only from 1899 since when over £100,000 has been spent upon its construction and development. At present the building comprises the nave, baptistery and Chapel of the Holy Spirit and Crossing but additions are constantly being made.

according to a preconceived plan which will eventually produce an edifice in keeping with a city of deep religious feelings and convictions.

Parliamentary Buildings

When self-government was granted to the Six Counties area of Northern Ireland in 1920 it was essential to provide a fitting home for the newly constituted legislature. For this purpose the 300-acre estate of Stormont Castle on the County Down side of the city was acquired the existing castle being used as the official residence of the Prime Minister. Near by was built the Speaker's House, a pleasing picture in red brick amidst a cluster of trees. The most imposing feature, however, is the Parliamentary Buildings erected upon a plateau cut in the hill about three-quarters of a mile from the main road to Newtownards. The buildings are approached directly by the Processional Road straight and broad flanked by trees and terminating in a terrace at the foot of an imposing flight of granite steps leading to the main plateau upon which the buildings stand. Another entrance from the west, named after the Right Hon. W. F. Massey (a great Ulsterman and a great Imperialist who was Premier of New Zealand) joins the Processional Road at a circle where is erected the statue of Lord Carson. From the main terrace a splendid view of

ONE HUNDRED AND FIFTH ANNUAL MEETING, BELFAST, JULY, 1937

Patron HIS MAJESTY THE KING

President SIR E. FARQUHAR BUZZARD, Bt., K.C.V.O., LL.D., D.M., F.R.C.P. Physician Extraordinary to H.M. the King, Regius Professor of Medicine, University of Oxford

President-Elect R. J. JOHNSTONE, B.A., M.B., F.R.C.S., F.C.O.G. Professor of Gynaecology, Queen's University, Belfast, Member of Northern Ireland Parliament

Chairman of Representative Body H. S. SOUTTAR, C.B.E., M.D., M.Ch., F.R.C.S.

Chairman of Council SIR KAYE LE FLEMING, M.A., M.D.

Treasurer N. BISHOP HARMAN, LL.D., F.R.C.S.

PROVISIONAL PROGRAMME

The Annual Representative Meeting will begin at the Assembly Hall on Friday, July 16, at 9.30 a.m., and be continued on the following three weekdays.

The statutory Annual General Meeting will be held at the Assembly Hall on Tuesday, July 20, at 12.30 p.m., and the adjourned meeting at 8 p.m.

The Annual Dinner of the Association will take place at the King's Hall on Thursday, July 22, at 7 p.m. The Popular Lecture will be given at the Assembly Hall on Friday, July 23, at 8 p.m.

The Conference of Honorary Secretaries will be held in the Assembly Hall on Wednesday, July 21, at 2.30 p.m. and the Over-seas Conference at the same place and time on Thursday, July 22.

A Combined Religious Service will be held in Fisherwick Presbyterian Church on Tuesday, July 20, at 4.30 p.m. High Mass will be celebrated "Coram Pontifice" at St. Patrick's Church, Donegall Street, on Thursday, July 22, at 9 a.m.

The Reception Room for registration at Ulster Hall will be opened at 2 p.m. on Monday, July 19. Ladies Club will be at Assembly's College.

The Annual Exhibition of Surgical Appliances, Foods, Drugs, and Books will be held in the Ulster Hall. The official opening will take place on Tuesday, July 20, at

9 a.m., it will remain open on July 21, 22 and 23, from 9 a.m. to 6 p.m.

The Pathological Museum and Exhibition of Radiographs, Physics Laboratories, Queen's University will be opened on Tuesday, July 20, at 11 a.m., and will remain open on the three following days from 9.30 a.m.

The clinical and scientific work will be divided among seventeen Sections, meeting at the Queen's University on Wednesday, Thursday, and Friday, July 21, 22, and 23. We publish below the names of the Sections and the officers appointed to each.

The following Sections will meet on Three Days

MEDICINE

President Professor W. W. D. THOMSON, M.D., F.R.C.P. (Belfast)

Vice-Presidents FOSTER COATES, M.D. (Belfast), F.G. HOBSON, D.S.O., D.M., F.R.C.P. (Oxford), W. MCLOPINAN, L.R.C.P. and S.I. (Belfast), Professor J. W. MCNEE, D.S.O., M.D., F.R.C.P. (Glasgow)

Honorary Secretaries S. I. TURKINGTON, M.D., 41 University Road, Belfast, EDWARD R. CULLINAN, M.D., F.R.C.P., 10 Park Square West, NW1

The following programme has been arranged

Wednesday, July 21 (Combined meeting with Section of Pathology, Bacteriology, and Immunology) 10 a.m., Dis
[1689]

ANNUAL MEETING THE SECTIONS

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

Discussion The Haemorrhagic States To be opened by Prof L J WITTS (London) and Dr N B CAPON (Liverpool) followed by Dr JANET M VAUGHAN (London) Pathological Aspects of Haemostasis and Dr W A TIMPERLEY (Sheffield), Treatment of Haemophilia

Thursday July 22—10 a.m. *Discussion* Cholecystitis To be opened by Prof J W MCNEE (Glasgow) followed by DAVID WILKIE (Edinburgh) Diagnosis and Treatment Sir GARRATT HARDMAN (Dublin) The Role of Surgery Dr T and Dr CHARLES H MILLER (London), Cardiac Pain in Gall-bladder Subjects

Friday July 23 (Combined meeting with Section of Surgery) —10 a.m., *Discussion* The Diagnosis and Treatment of Abscess of the Lung To be opened by Dr L S T BURRELL (London) and Mr J E H ROBERTS (London) followed by Dr PETER KERLEY (London) Dr CARL SEMB (Oslo) Dr GEOFFREY MARSHALL (London) Dr W BURTON WOOD (London) and Mr G R B PURCE (Belfast) (Members of the Section of Radiology will be welcome at this discussion)

Problem of Habitual Abortion and Mr V B GREEN ARMYTAGE (London) Hystero-salpingography—its Obstetrical and Gynaecological Importance

Thursday July 22 (Combined meeting with Section of Nutrition)—10 a.m. *Discussion* The Nutritional Needs in Pregnancy To be opened by Sir ROBERT MCCARRISON (Oxford) Dame LOUISE MCLROY (London) and Dr G C M M GONIOLE (Stockton on Tees) followed by Dr LUCY WILLIAMS (London) and Dr MARGARET I BALFOUR (London) Paper Mr D W CURRIE (Leeds) The Use of Vitamin E in Habitual Abortion (Members of the Section of Hygiene and Public Health will be welcome at this meeting.)

Friday July 23—Demonstration by Prof JOSEPH DE LEE (Chicago) of talking motion picture of the Forceps Operation including Episiotomy and its Anatomy Paper Mr C H G MACAFEE and Mr H I MCCLURE (Belfast) A Critical Survey of 349 Cases of Breech Delivery

PATHOLOGY, BACTERIOLOGY, AND IMMUNOLOGY

President Sir THOMAS HOUSTON OBE., M.D (Belfast)
Vice-Presidents Professor S PHILLIPS BEDSON, M.D F.R.S. (London) S C DYKE D.M. FRCP (Tottenham Staffs) N C GRAHAM M.C., M.B. Ch. (Muckamore, Co. Antrim), Professor J S YOUNG M.C., M.D (Belfast)

Honorary Secretaries Miss EILEEN M HICKEY, M.D M.R.C.P.I., 31 College Gardens Belfast Miss JANET M VAUGHAN D.M., M.R.C.P. British Post Graduate Medical School, Hammersmith Hospital Duane Road, W12

The following programme has been arranged
Wednesday July 21 (Combined meeting with Section of Medicine)—10 a.m., *Discussion* The Haemorrhagic States To be opened by Prof L J WITTS (London) and Dr N B CAPON (Liverpool) followed by Dr JANET M VAUGHAN (London) Pathological Aspects Dr S C DYKE (Wolverhampton), Blood Transfusion Dr R G MACFARLANE (London) Mechanism of Haemorrhage and Haemostasis and Dr W A TIMPERLEY (Sheffield), Treatment of Haemophilia

Thursday July 22 (Combined meeting with Section of Radiology)—10 a.m., *Discussion* Bone Tumours. To be opened by Dr R E. ROBERTS (Liverpool) Prof J S YOUNG (Belfast) and Mr HARRY PLATT (Manchester) followed by Dr J DUNCAN WHITE (London) and Dr J F BRAILSFORD (Birmingham) Members of the Section of Orthopaedics will be welcome at this discussion)

Friday July 23—10 a.m. *Discussions* (1) Influenza To be opened by Dr C H ANDREWES (London) followed by Dr C H STUART HARRIS (London) Dr R W FAIRBROTHER (Manchester) and Dr J G SCADDINO (London) (2) Staphylococcal Infections in Man To be opened by Prof J V BIGGER (Dublin) followed by Dr EILEEN O BARTLEY (Belfast)

PHARMACOLOGY AND THERAPEUTICS, INCLUDING ANAESTHETICS

(One Day to be devoted to Anaesthetics)

President Professor E. B. C. MAYRS M.D., DPH (Dunmurry, Co. Antrim)
Vice-Presidents OLIVE M ANDERSON M.D., D.A. (Belfast) Professor DAVID CAMPBELL, M.C. M.D. FRFPS (Aberdeen) Professor J H GADDUM M.R.C.S., L.R.C.P. (London) W B PHIMROSE M.B., Ch.B. (Glasgow)

Honorary Secretaries J T LEWIS M.D. FRCP 25 College Gardens, Belfast Miss KATHARINE G LLOYD WILLIAMS, M.D. 48 Gordon Square WC1

The following programme has been arranged
Wednesday July 21—10 a.m. *Discussion* Individual Variations in Response to Drugs To be opened by Prof A J CLARK (Edinburgh) followed by Prof J H GADDUM (London) and Colonel L. W. HARRISON (London) 12 noon Paper Dr J F BROCK (Cambridge) Iron Therapy in Hypochromic Anaemia

Thursday July 22—10 a.m. *Discussion* The Treatment of Circulatory Failure To be opened by Dr J CRICHTON BRAMWELL (Manchester) followed by Prof K D WILKINSON (Birmingham) Dr S B BOYD CAMPBELL (Belfast) Dr A R GILCHRIST (Edinburgh) and Dr E. P. POLLTON (London)

SURGERY

President Professor P T CRAMBLE M.B. FRCS (Belfast)
Vice-Presidents Professor L R BRAITHWAITE M.B. FRCS (Leeds) ADAMS A MCCONNELL M.B., FRCS1 (Dublin) HOWARD STEVENSON M.B. FRCS1 (Belfast) REGINALD M VICK, OBE., M.Chir., FRCS (London)

Honorary Secretaries H P MALCOLM, M.C. M.B., M.Ch., 27 College Gardens Belfast HAROLD C EDWARDS M.B. M.S., FRCS, 57 Queen Anne Street, W1

The following programme has been arranged
Wednesday July 21—10 a.m. *Discussion* The Surgical Treatment of Non-stenosing Peptic Ulcer To be opened by Prof JOHN MORLEY (Manchester) followed by Mr N C LAKE (London) Mr W H OGILVIE (London) and Dr CARL SEMB (Oslo) Paper Mr H W RODGERS (London) The Use of the Gastroscope in Cases of Dyspepsia with Normal X Ray

Thursday July 22—10 a.m. *Papers* Prof L R BRAITHWAITE (Leeds) The Significance of Bile in the Stomach Prof A K HENRY (London) Factors in the Successful Treatment of Severe Burns Mr J G YATES BELL (London) The Steinach Operation for the Relief of Prostatic Symptoms and Mr E W ARCHIBALD (Montreal) Cutting the Sphincter of Oddi for Relief of Pain following Cholecystectomy and Recurring Pancreatitis without Stone and for Subacute Cholangitis

Discussion Obstructions of the Common Bile Duct To be opened by Mr E R FLINT (Leeds) followed by Mr HOWARD STEVENSON (Belfast) and Mr G GORDON TAYLOR (London)
Friday July 23 (Combined meeting with Section of Medicine)—10 a.m. *Discussion* The Diagnosis and Treatment of Abscess of the Lung To be opened by Dr L S T BURRELL (London) and Mr J E. H. ROBERTS (London) followed by Dr PETER KERLEY (London) Dr CARL SEMB (Oslo) Dr GEOFFREY MARSHALL (London) Dr W BURTON WOOD (London) and Mr G R B PURCE (Belfast) (Members of the Section of Radiology will be welcome at this discussion)

OBSTETRICS AND GYNAECOLOGY

President Professor C G LOWRY M.D. FRCS1, FCOG (Belfast)
Vice-Presidents ALEX. J DEMPSEY M.B. FCOG (Belfast) T S S HOLMES M.Ch. FRCS, FCOG (Belfast) Professor A LEYLAND ROBINSON M.D. FRCS FCOG (Liverpool) WILFRED SHAW M.D., FRCS FCOG (London)

Honorary Secretaries C H G MACAFEE M.B. FRCS FCOG 18 University Square Belfast Mrs. HILDA N LLOYD M.B. FRCS, FCOG, 40, Harborne Road Edgbaston Birmingham

The following programme has been arranged
Wednesday July 21—10 a.m. *Discussion* The Clinical Value of Protonal and Similar Compounds in the Treatment of Puerperal Infections To be opened by Mr G F GIBBERD (London) Papers Mr PERCY MALPAS (Liverpool) the

12 noon, *Paper* Dr NATHAN MUTCH (London) Therapeutic Use of Magnesium Trisilicate

Friday July 23—Session to be devoted to Anaesthetics 10 a.m., *Discussions* (1) Anaesthesia in Minor Surgery To be opened by Dr J H CHALLIS (Woodford Green) (2) Vinyl Ether (with cinema film) To be opened by Dr V A. GOLDMAN (London)

The following Sections will meet on Two Days

ANATOMY, PHYSIOLOGY, AND BIOCHEMISTRY

President Professor E C. DODDS, M.D., F.R.C.P. (London)

Vice-Presidents Professor HENRY BARCROFT M.D. (Belfast) Professor R J BROCKLEHURST D.M. (Bristol) Professor MARY F LUCAS KEENE M.B., B.S. (London) Professor B A McSWINEY, M.B., B.Ch. (London)

Honorary Secretaries RICHARD H HUNTER M.D. M.Ch. Anatomy Department, Queen's University Belfast, Professor A. WORMALL, D.Sc., Department of Biochemistry St Bartholomew's Hospital Medical College E.C.1

The following programme has been arranged

Wednesday July 21—10 a.m. Discussion The Anatomy Physiology and Biochemistry of the Sex Glands To be opened by Prof E C DODDS (London) followed by Dr A S PARKES (London) Prof A B APPLETON (London) Dr P M F BISHOP (London), and Dr J M ROBSON (Edinburgh) *Papers* Prof W J E JESSOP (Dublin) Clinical Bearings of the Parathyroids Prof A WORMALL (London) Recent Work in the Chemistry of Insulin Prof T H MILROY (Edinburgh) Chemical Mediators in Nervous Activity and Dr R D LAWRENCE (London) The Use of Protamine Insulin and Similar Preparations 2.30 p.m. Demonstration at Pathological Institute of Cinema Film by Sir JOSEPH BARCROFT and Dr D H. BARRON (Cambridge) The Effect of Experimental Lesions in the Central Nervous System on the Growth and Movements of the Foetus

Friday July 23—10 a.m. Discussion Visceral Pain To be opened by Prof J MORLEY (Manchester) followed by Prof J R LEARMONTH (Aberdeen) Prof B A McSWINEY (London) Prof D T BARRY (Cork), and Dr E P POULTON (London) *Papers* Dr J DIXON BOYD (Cambridge) The Affluent Nerve Supply of Arteries with Special Reference to Pressor Receptors Dr D H SMYTH (Göttingen and Belfast) Vascular Reactions of the Kidney in Response to Carotid Sinus and Other Reflexes and Dr S NEVIN (London) The Application of Advances in Physiology and Biochemistry to the Study of Diseases of Muscle

DISEASES OF CHILDREN

President H. MORLEY FLETCHER, M.D. F.R.C.P. (London)

Vice-Presidents Professor SEYMOUR G BARLING C.M.G. T.D. M.Ch. F.R.C.S. (Birmingham) ROBERT MARSHALL, M.D. F.R.C.P.I. (Belfast) M BRICE SMYTH M.B. B.Ch. (Belfast)

Honorary Secretaries T H CROZIER M.D. M.R.C.P., 3 University Square Belfast URSULA SHELLEY, M.D., M.R.C.P., 79, Harley Street W.1

The following programme has been arranged

The Local Honorary General Secretary of the Meeting is Dr F M B Allen, Whittla Medical Institute, College Square North, Belfast

HOTEL AND LODGING ACCOMMODATION AT BELFAST

The facilities for housing the members who contemplate visiting Belfast for the Annual Meeting next July has given the local committee a considerable amount of anxiety, but it is anticipated that those available will meet the requirements of all visitors. A list of suitable hotels is given below, and as stated the booking of *hotel accommodation* has been placed exclusively in the hands of Messrs Thos Cook and Son and if applications are made at their office, 27 Royal Avenue, Belfast, they will allocate rooms in order of application. No booking fee is charged, but a small deposit will be asked for on reservation being made. The deposit will be credited when the account is settled, or returned if it is found that the room is not required.

A register of lodgings is in course of preparation, and various students hostels also are available. Booking of these will be arranged through the Local Executive Office, and applications for hostel or boarding house accommodation should be addressed to the Secretary, B.M.A., Whittla Medical Institute, College Square North, Belfast.

A number of residents have offered *private hospitality* and this will also be available. Those members desirous of utilizing this should also apply to the secretary at the above address.

* Allocation of rooms not stated but will probably have 10 free

† Allocation of rooms not stated but probably 50 free

All arrangements for the booking of rooms in hotels are in the hands of Messrs Thomas Cook and Son, Ltd Royal Avenue Belfast to whom all applications for hotel accommodation should be sent

ACCOMMODATION AND CRUISE ON S.S. "ALMANZORA"

To supplement the limited accommodation in an attractive manner arrangements have been made, with the approval of the Council of the Association, for provision of accommodation on board the s.s. *Almanzora*. During the period of the meeting the liner will be moored, in order that members may take a full part in all the social and scientific activities. Moreover, the mooring berth will be adjacent to a tram service which will take members to the city centre in ten to fifteen minutes. At the close of the meeting the liner will leave Belfast and, proceeding via the Inner and Outer Hebrides and Scapa Flow, will cruise in the Norwegian Fjords, visiting Trondhjem, Merok, Helsing, Oie, and other places of interest. The liner will return to Southampton on August 3. This cruise has been planned by Pickfords Travel Service in conjunction with the Royal Mail Lines and members of the Association who propose to attend the Belfast meeting and are interested in these arrangements are asked to make an early application to Messrs Pickfords at 205 and 206, High Holborn, W.C.1, or at any of their branches.

TRAVELLING ARRANGEMENTS AND "CONFERENCE" TICKETS

As on this occasion the journey to the place of meeting necessitates travel outside the limit of the English railways, arrangements have been made for the issue to members and those accompanying them to Belfast of a special Conference Ticket at the rate of the ordinary first or third class single fare plus one third for the return journey. This conference rate is more favourable than the special summer or monthly ticket available to all travellers by rail, and can only be obtained on presenting a voucher at the booking office of the station of departure. The vouchers can be obtained from the Financial Secretary, B.M.A. House, Tavistock Square, London, W.C.1, a separate voucher being required for each individual travelling.

Members must make their own individual arrangements for sleeping accommodation on steamers crossing to Ireland, and Messrs Pickfords help can be sought in this matter. Those who propose to travel by the Stranraer-Larne route are warned that on account of the Glasgow Fair holiday traffic little or no accommodation will be available on the steamers operating on this route. The railway company, however, has offered to provide a special steamer for the benefit of members of the Association provided an early indication can be obtained of the probable numbers travelling. To assist the railway and shipping companies concerned therefore, early communication with Messrs Pickfords is urged.

For those members who are interested in air travel inquiries are being made from the companies operating air routes to Belfast, and it is hoped to publish a further notice later.

CONVEYANCE OF MOTOR CARS

The following details regarding the conveyance of privately owned motor cars accompanying passengers to Belfast have been furnished by the Railway Clearing House

Motor cars accompanying passengers holding not less than one first-class or two third-class adult tickets per car are conveyed by passenger train between the points for which the tickets are available at the following specially reduced rates at owner's risk

Single rail journeys Minimum 50 miles 3d per mile per car

Return rail journeys Minimum 50 miles (outward journey) 4½d per mile per car on the single journey mileage provided

return passenger tickets are taken out and the motor car is booked for the double journey at the starting point

The foregoing arrangement applies in Great Britain only

Privately owned motor cars are also accepted for conveyance between British and Irish ports, and charged rate and a half for the double journey at owner's risk provided not less than two adult passengers accompany each car in both directions and that the motor cars travel by the same route on both the outward and return journeys. The motor cars are only booked through to the destination shown on the passengers' tickets and no break in the journey is allowed. Passengers must produce their tickets for the journey before the motor car will be accepted for carriage under these arrangements. Arrangements must be made beforehand in all cases

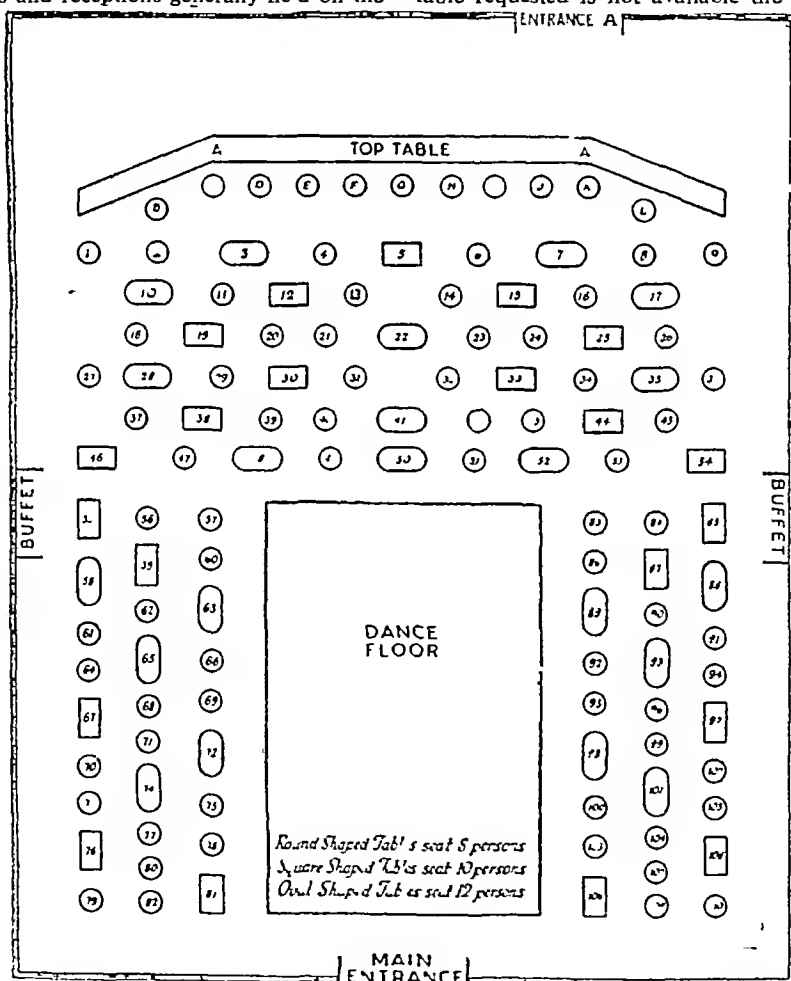

THE ANNUAL DINNER, JULY 22

AN INNOVATION

An innovation is being made in the form of the Annual B.M.A. Dinner at the Belfast Meeting on Thursday, July 22. The Local Executive feels that a purely formal dinner such as has been held on previous occasions does not make as wide an appeal to the younger members of the Association as the dances and receptions generally held on the

size of the main hall at Olympia but the very efficient sound amplifying system will ensure that speeches will be clearly heard in all parts of the room

It is hoped that members will make up their own parties and seats may be booked according to the position on the Table Plan, which is reproduced on this page. If the exact table requested is not available the nearest table of that

other evenings of the Meeting, and accordingly has decided to hold a dinner-dance instead

The Kings Hall, Balmoral which has been booked for the occasion, is capable of accommodating some 1,200 guests at tables for 8, 10, or 12 persons arranged in horse-shoe formation round a specially laid dance floor. The toast list and speeches will be limited, and it is hoped that dancing will start about 10 o'clock. The Hall is about

size will be allocated. Where a request is made for parties not large enough to fill a table seats will be allotted by the Dinner Committee. The ticket for the dinner and dance will 10s 6d., exclusive of wines and seats may be booked in advance upon receipt of payment

Applications should be made to the Dinner Secretary, B.M.A. 105th Annual Meeting, Whitla Medical Institute, College Square North, Belfast

THE ASSOCIATION OVERSEAS

Work of Dominions Committee

At the conclusion of the meeting of the Dominions Committee on March 18 one member suggested that the Council of the Association be requested to provide a large map of the world which could be unrolled in the committee room at each meeting. Certainly the members of the Committee are required to have the British Empire at their fingers' ends. During the meeting questions came up for discussion relating to medical service in several places in the West Indies—Windward Islands, St. Lucia, Trinidad—British Guiana, Nigeria and the Gold Coast, Northern Rhodesia and Kenya, Egypt and the Sudan, Hong Kong, Tonga in the Pacific, and Sarawak. It was believed to be the first time that Sarawak, which is an independent State under British protection and with a British rajah, had swung into the Committee's ken. It came forward that the service there had some disadvantageous aspects in regard to remuneration, leave and other matters and it was decided to ask for the observations of the London Office of the Sarawak Government on the complaints made.

Deputation to Colonial Office

The chairman (Dr. William Paterson) reported that a deputation from the Association had been received by representatives of the Colonial Office, when various matters which the Committee has had before it at previous meetings were discussed. These included questions affecting the Colonial Medical Service as a whole and also specific complaints from various parts of the Colonial Empire. Dr. Paterson said that the deputation was very courteously received by Sir George Tomlinson, Assistant Under-Secretary, and Sir Thomas Stanton, Chief Medical Adviser, and departmental officers were called in from time to time as different subjects were reached. In some conversation on the system of short-term appointments in the Service, which the deputation suggested might be extended to all colonies, it was pointed out on the other side that the system was foreign to the conception of the Civil Service as one which was intended to provide a life career to attract officers who desired to spend their working lives in it, and to retain the services of efficient men until the normal age of retirement.

Another point made by the deputation was that for the purposes of pensions, seniority, and salary account should be taken of any employment in a hospital immediately preceding appointment to the Service. To this the reply was made that officers are recruited for the Colonial Medical Service at a somewhat later age than for the Army and in the normal course of events applications from persons who have not held a hospital appointment are not considered. (The Committee thought that the Colonial Office might well be asked to state how many exceptions there have been to this rule in recent years.) It was also pointed out from the Government side that for technical reasons it would not be possible to reckon non-Government service towards pension, that the fact that medical officers are appointed at a somewhat later average age than officers in other branches of the Service is generally recognized by higher initial rates of salary and that the possession of special qualifications is in appropriate circumstances recognized by a higher initial salary than the normal minimum. It was stated that the various levies on salaries imposed by a number of Governments during the economic crisis had nearly all been removed. Those remaining, in Hong Kong and British Honduras would, it was hoped, not long continue. A very general restoration of travel and other allowances was also reported.

The deputation raised questions arising out of the revision of conditions of service in West Africa and sympathetic examination was promised. On the question of a change of policy in Hong Kong, whereby private practice has been disadvantaged, it was agreed that the Branch

should be informed that the matter had been the subject of conversation with the Colonial Office, and should be asked to submit representations to the Governor with the request that, if he felt unable to meet them, he should forward the correspondence, with his observations, to the Secretary of State. With regard to the Windward Islands Medical Service the deputation was informed that various reforms concerning salary scales were in process of being made and with regard to a question from Tonga it was promised that it would be considered what action could usefully be taken, though it appeared that the extent to which the Secretary of State is in a position to bring pressure to bear on the Tonga Government in these matters is limited.

Uniforms and Precedents

A report was made by Dr. J. L. Gilks, a member of the Committee, on a question which had arisen as to orders of precedence and regulations for the wearing of uniforms in certain colonies. The subject proved a very delicate one especially as regards the relative position of administrative and medical officers. Dr. Gilks said that in his view the administrative officer must always be the head of his own province or district, and that it would be wrong for him to be classed for uniform purposes below the medical officer serving possibly in his district. To grade officers for uniforms or precedence according to the salaries they drew or the length of their service would be quite impossible. This question had been raised by a communication from Zanzibar, and there Dr. Gilks said that the general table of colonial precedence showed chief commissioners, Government agents, and residents of provinces coming immediately before members of the Houses of Assembly, therefore the provincial commissioner would precede heads of departments unless the latter were members of the executive or legislative council. It did not appear whether the director of medical services was a member of any council in the Protectorate, if he was not, presumably he would be placed below the provincial commissioner.

This was evidently a thorny subject, and the Committee could only instruct that the Branch which had raised the question should be possessed of the information which Dr. Gilks had so painstakingly elicited and the view he had expressed.

From Various Quarters

A resolution from the Kenya Branch was before the Committee deprecating the method by which the retirement of a member of the East African Medical Service from a hospital appointment had been announced before any notification of it had been made to the member concerned and before he had intimated any desire to retire. It was agreed to request the Branch to say what action it would like the central office to take in the matter.

A letter from the director of the Sudan Medical Service was received explaining a wrongly worded paragraph in a pamphlet which had given rise to some misunderstanding and to which the Committee's attention had been drawn. The chairman said that he thought the Committee would take the view that the conditions of service were satisfactory.

Correspondence was reported with the Egyptian Embassy over a question of alteration of an official salary by reason of a municipal law. It was requested on behalf of the Association that to avoid future misunderstandings advertisements of vacant appointments should state clearly that official salaries were subject to such alterations. A further reply was awaited.

Inquiry had been made following a point raised at the previous meeting, of the Gold Coast Branch of the British Red Cross Society. This Branch exists to supplement and co-ordinate maternity and child welfare services and there was some suggestion of encroachment on private practice. The reply of the Branch was considered satisfactory and the hope was expressed that in any future development of

the service the possibility of any such encroachment would be borne in mind

The report of the committee appointed by the Trinidad Government to inquire into the general organization of the medical service of the colony was forwarded. It was decided to await the observations of the Trinidad and Tobago Branch. A similar report from British Guiana was accompanied by the comments of the Branch and it was agreed to send these comments as an expression of Branch opinion to the Colonial Office.

The retirement of Sir Thomas Dunhill from the membership of the Council as representing certain Australasian Branches was announced, to the great regret of the Committee, which passed a resolution of thanks to him for his long services.

Return of the Medical Secretary

The Medical Secretary was warmly welcomed on his return from India. In response, Dr Anderson mentioned the great hospitality which had been extended to him on every hand and gave an outline of the problems which he had had to consider. The Chairman of Council read a letter which had been received from Major-General D. S. Skelton, Acting Director of Medical Services in India, stating that the visit of the Medical Secretary had been of enormous value that he had created the friendliest possible atmosphere all over the country, and had done much to remove misunderstandings and misconceptions from the minds of their Indian friends. General Skelton congratulated the Council on having sent out to India an ambassador who had already brought about such important results.

PUBLIC HEALTH NOTES

Association of Public Vaccinators of England and Wales

In his presidential address at a recent meeting of the Association of Public Vaccinators, Dr James Bennett of Warrington reviewed the activities of the association since the war. In addition to such multifarious activities as advising members, assisting in the solution of difficulties arising between public vaccinators and their employers, and following and counteracting the activities of the anti-vaccinationists, the association has been intimately concerned with a number of major matters. One was the effort, ultimately successful, to secure restoration of the fee of 5s per case; the fee was reduced to 2s 6d in 1907. Another was the revision and re-editing of *The Truth about Vaccination*, a pamphlet which, as a statement of the case for vaccination, is in large demand for distribution by public vaccinators; it is also being issued by some maternity and child welfare authorities at their infant welfare centres. The changes in the employment of public vaccinators brought about as a result of the passing of the Local Government Act, 1929 by which the control of vaccinators passed from the boards of guardians to the councils of counties and county boroughs, have been closely watched by the association. Lastly, steps have been taken to combat the suggestion that compulsory vaccination should be abolished. The association points to the very small extent to which immunization against diphtheria is carried out in this country as an indication of the low level to which vaccination of infants would fall if compulsion were removed, and made representations on these lines to those organizations which at different times, were disposed to move for the repeal of legislation on this matter.

Public Health Appointments

The following changes have recently been made in the Public Health Service medical staffs

Dr S. Harvey, deputy medical officer of health for Kincardineshire to be assistant medical officer of health for Dumbartonshire

Dr G. J. Roberts, deputy county medical officer for Denbighshire to be deputy medical officer of health and deputy school medical officer for Bootle.

Dr Doris S. Williams, resident medical officer at Sheffield Municipal Hospital, to be assistant medical officer for Wallasey

Dr T. Adam is to retire next month from the appointment of medical officer of health for Stirlingshire

Dr D. H. Pennant has been elected a member of the Pembrokeshire County Council and has consequently resigned his appointment as district medical officer for the Narberth area

Correspondence

DELAY IN CHOOSING A PANEL DOCTOR

SIR,—I am the South Coast medical practitioner referred to in the *Supplement* of March 13 (p. 132) and after the pronouncement of the Insurance Acts Committee I was prepared to drop the matter in disgust having fruitlessly argued and pleaded with panel committees, insurance committees and in person with the Medical Secretariat. I am bound to admit that my Panel Committee and its representative pressed the matter with enthusiasm. It seems that the remedy I suggested having been found unsuitable the disease must be allowed to run unchecked by any other method of treatment.

The letter of Dr Alistair French in your issue of April 3 (p. 168) encourages me to reopen the subject with my Panel Committee. As he rightly points out the population of a newly built up area is not for the most part, a shifting one and there is no measure of equity, rough or ready.

The clerk to my Insurance Committee recently issued a laboured memorandum justifying a do-nothing attitude on the strength of a questionnaire sent round to a number of my recent acceptances. As I answered the questions for most of the patients myself the futility of such a procedure is obvious. To disprove my claim that in the end a patient usually called in the nearest doctor when driven by illness to choose one, this same clerk examined the prescriptions dispensed by the chemist up the hill from my house, though I could have told him that most of my people go to the chemist down the hill or into the neighbouring town. All this may help to prove that it is the doctor doing the work who knows the difficulties which may never be shown by statistics. It is a rule that the patient should choose a doctor without delay, but does anyone care a jot if that rule is obeyed? There is trouble if the doctor—for his part—does not obey his rules.

The scheme adopted by the London Insurance Committee seems a good one if only the patient will bother to remove his nice new card from the envelope in which it is sent to him! I am making quite a collection of URGENT notices removed from the unopened envelopes of delayed presentations. Now that the under 16's are soon to be included in insurance is this not a good opportunity to see that they will be trained—or forced—to obey the first rule and make the much prized free choice of doctor?—I am etc.

April 3

SOUTH COAST PRACTITIONER.

PARKING OF DOCTORS' CARS

SIR—After reading the letters you have recently published on this subject it would appear that the only remedy for doctors practising in the London district or other overcrowded areas would be to employ a chauffeur. As economic considerations must render this, in many cases, impossible perhaps Mr. Hore Belisha might be persuaded to make a grant from the Road Fund to enable doctors who otherwise could not afford a paid driver to employ one. Seriously, Sir, some settlement of the matter is urgently needed—I am, etc.

Bridlington March 28

C. J. GORDON TAYLOR.

 partments Salary £150 p.a.
 LONDON COUNTY COUNCIL—(1) Assistant Pathologist for the White
 chapel Clinic for the treatment of venereal diseases Turner
 Street, E. Salary £500 p.a. (2) A.M.O.s (Grade I) to (a) Pad-
 dington Hospital W., (b) St Andrew's Hospital, E., (c) St
 Clement's Hospital, E., (d) St George in the East Hospital E.
 Salaries £350-£25-£425 p.a. each (3) A.M.O.s (Grade II) to
 (e) Lewisham Hospital S.E., (f) Paddington Hospital W. (g)
 St George in the East Hospital E. Salaries £250 p.a. each
 Unmarried (a), (b), (c), (d), (f) and (g) are male appointments
 only
 LONDON JEWISH HOSPITAL Stepney Green, E.—Assistant Anaes-
 thetist Honorarium £115 6d per attendance
 LONDON LOCK HOSPITAL Harrow Road W.—R.M.O. to the Male
 Departments Salary £175 p.a.
 MACCLESFIELD GENERAL INFIRMARY—Second H.S. Salary £150
 p.a.
 MANCHESTER ANCOATS HOSPITAL—Full time Radiological Officer
 (non resident) Salary £300 p.a.
 MANCHESTER CITY—(1) Deputy Medical Superintendent for Booth
 Hall Hospital for Children (2) R.J.A.M.O. (male Grade II)
 for Baguley Sanatorium Salaries £550 p.a. and £250 p.a.
 respectively
 MANOR HOUSE HOSPITAL Golders Green N.W.—Assistant Visiting
 P. to Out patients Remuneration £115 6d per session
 METROPOLITAN HOSPITAL Kingsland Road E.—(1) Senior H.P.
 (2) Senior H.S. (3) J.H.P. (4) J.H.S. (5) C.O. and Resident
 Anaesthetist Males Salaries £100 p.a. each
 MIDDLESBROUGH NORTH ORMESBY HOSPITAL—H.P. (male un-
 married) Salary £120 p.a.
 MIDDLESEX COUNTY COUNCIL—Assistant Pathologist for Redhill
 County Hospital Edgware Salary £650-£25-£800 p.a.
 MINISTRY OF HEALTH Whitehall, S.W.—Temporary Serologist
 Salary £850 p.a.
 MORLEY BOROUGH—Assistant M.O.H. and Assistant School M.O.
 Salary £500-£25-£700 p.a.
 NATIONAL DENTAL HOSPITAL University College Hospital Gower
 Street W.C.—Hon. Assistant Anaesthetist
 NATIONAL TEMPERANCE HOSPITAL Hampstead Road N.W.—H.P.
 (male) Salary £100 p.a.
 NEWARK GENERAL HOSPITAL—R.H.S. (male unmarried) Salary
 £175 p.a.
 NEWCASTLE UPON TYNE ROYAL VICTORIA INFIRMARY—Hon. S.
 NORTHUMBRIA COUNTY COUNCIL—A.M.O. (unmarried) at
 Wooley Sanatorium, near Hexham Salary £350-£25-£450 p.a.
 NORTHWOOD MOUNT VERNON HOSPITAL—H.S. Salary £150 p.a.
 NORWICH CITY—R.M.O. to the Isolation Hospital Assistant
 M.O.H., and Assistant School M.O. Salary £450-£50 p.a.
 NORWICH NORFOLK AND NORWICH HOSPITAL—H.S. (male un-
 married) to the Special Departments Salary £160 p.a.
 NOTTINGHAMSHIRE COUNTY COUNCIL—Assistant School M.O. (male)
 Salary £500-£25-£700 p.a.
 NOTTINGHAM GENERAL HOSPITAL—(1) H.S. for Ear, Nose, and
 Throat Department (2) R.C.O. (male) Salaries £150 p.a. each
 PLYMOUTH PRINCE OF WALES'S HOSPITAL Devonport—J.H.S.
 Salary £120 p.a.
 POOLE CORNELIA AND EAST DORSET HOSPITAL—(1) R.S.O. (2)
 H.P. Males unmarried Salaries £200 p.a. and £150 p.a.
 respectively
 PORTSMOUTH ROYAL PORTSMOUTH HOSPITAL—H.S. (male) Salary
 £130 p.a.
 PORTSMOUTH AND SOUTHERN COUNTIES EYE AND EAR HOSPITAL—
 H.S. Salary £150 p.a.
 PRINCESS BEATRICE HOSPITAL Earl's Court S.W.—Medical Regis-
 trar Honorarium £52 10s
 PRINCESS LOUISE KENSINGTON HOSPITAL FOR CHILDREN St Quintin
 Avenue W.—Hon. Radiologist
 QUEEN'S HOSPITAL FOR CHILDREN Hackney Road E.—(1) Clinical
 Assistant for Medical Out patient Clinics Honorarium 7s per
 attendance (2) H.S. Salary £100 p.a.

 not later than, the first post on Tuesday mornings

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and
 Deaths is 9s which sum should be forwarded with the notice
 not later than the first post on Tuesday morning in order to
 ensure insertion in the current issue

BIRTH

JAMES—On March 25 to Dorothy wife of T G Hild James
 F.R.C.S. a son

MARRIAGE

BATT—MURPHY—On April 7 1937 at the Methodist Church
 Cambridge Road King's Heath by the Rev. H. Percival Harris
 assisted by the Rev. G. H. Bainbridge Alan Michael Ferens
 M.R.C.S. L.R.C.P., D.C.O.G., younger son of Mr and Mrs
 G F Baily of Grove Avenue Moseley to Kathleen Joan only
 daughter of Mr and Mrs A. H. Murphy of Greenhill Road
 Moseley Birmingham Home address—103 Main Street
 Thurston Leicester

the surrounding hills is obtained and the extent of the city can be appreciated.

The foundation stone of the Parliamentary Buildings was laid by His Grace the Duke of Abercorn, K.P., the first Governor of Northern Ireland, in 1928 and they were formally opened by H.R.H. the Duke of Windsor (then Prince of Wales) in 1932. The architectural style is Greek Classical, Portland stone being used for the facing of the exterior and unpolished Slieve Donard granite for the basic plinth. The interior is constructed on the principle of the Houses of Parliament at Westminster, two chambers being provided—a house for the Senate another for the Commons. The interior decorations are carried out in modern style and for the panelling English walnut is used. The electrolier suspended from the ceiling in the main hall was the personal gift of His late Majesty King George V. The Government of Northern Ireland will hold an afternoon reception at Stormont in honour of the visiting members of the Association so that visitors will have an opportunity of inspecting the buildings.

The King's Hall, Balmoral

The Royal Ulster Agricultural Society had its origin in 1826, and has been closely bound up with the agricultural life and development of Ulster. The annual show held in May attracts a larger attendance than any agricultural exhibition in Great Britain or Ireland. The society has made remarkable progress, and in 1933 showed its enterprise in erecting a magnificent exhibition hall the King's Hall, opened in 1934 by H.R.H. the Duke of Gloucester. The dimensions of the building are surprising and it is only when one is told that the floor space is equal in size to that of the National Hall at Olympia that one realizes the truth of the statement. It is proposed to hold the Annual Dinner and Dance in this hall a special dance floor the size of a large ballroom being laid in the centre, with tables to accommodate 1100 diners round the floor. The most modern system of sound amplification is available for what promises to be a unique and memorable occasion.

Stranmillis Training College and Schools

A record of the buildings associated with the establishment of the Government of Northern Ireland would be incomplete without reference to the changes instituted by the Education Act of 1923. Ireland as a whole was at one time notorious for the inadequate provision of schools both primary and secondary, and for their poor equipment. One of the earliest undertakings of the new Government after its establishment in 1920 was to remove this reproach, for which there never had been opportunity (nor an agreed policy) at Westminster. The reorganization of primary education involved the building of a Training College for teachers at Stranmillis, and of a series of new public elementary schools throughout the province. The Training College, which is in the Georgian style is fully equipped to provide a staff of trained teachers under the supervision of the Ministry of Education. Regional education committees have been set up, and are given a certain degree of local control of the schools in their area, they are responsible for the provision and maintenance of schools. Throughout the countryside and in the cities the visitor cannot but be impressed by the modern buildings which now serve as educational centres. They are all of much the same general architectural style, and are models of their kind. The provision of the Training College and of these schools has cost upwards of two million pounds and a further million is required to complete the scheme.

The Cave Hill, Hazelwood, and Bellevue

Belfast is fortunate in that as the city extended all the green areas have not been encroached upon by the builder. The result is that many open spaces and parks have been preserved for the amenities of the citizens within easy reach of the city centre. The Royal Botanic

Gardens, just over a mile from Castle Junction and close to Queen's University are notable for their tropical house. Ormeau Park is one of the largest of the parks covering 175 acres and stretching along the banks of the River Lagan.

The outstanding feature of Belfast's open spaces, however is the development of the Cave Hill area. From many of the city streets the surrounding Antrim Mountains are visible, Divis, the Cave Hill and the Black Mountain forming a welcome background. Best known to the citizens is the Cave Hill, from which a magnificent view of Belfast Lough can be obtained. The tramcar on the Glengormley route travels along the gradual ascent of the Antrim Road, on the left being the rugged mass of the Cave Hill and on the right the well-wooded country slopes down to the sea 300 feet below. Sheltering under the Cave Hill are the estates of Belfast Castle, Hazelwood and Bellevue. The former was the residence of the Earl of Shaftesbury, who has recently presented it to the City Corporation together with 200 acres of demesne. Close by is Hazelwood which is connected to the pleasure grounds of Bellevue by a miniature railway. The natural appeal of Hazelwood has been largely retained and its beauties have not been unduly commercialized. The Floral Hall is used for concerts and dancing and from its refreshment lounge on the first floor one of the most spectacular views of sea and country is obtained. On a fine bright day the charm of Nature lies unfolded before the gaze the pleasing view of sea the distant hills of Down and the nearer view of the rugged mountains of Antrim are presented in a vivid panorama. Bellevue is an amusement park and lacks the quiet appeal of Hazelwood but the Zoological Gardens are well worth a visit as they contain an interesting collection of animals accommodated in accordance with the most modern practice so that they enjoy a considerable degree of freedom in their pseudo natural surroundings.

Other Buildings

The Custom House, from the famous steps of which noted street orators harangued their audiences in the best traditions of Hyde Park, the Belfast Harbour Office the scene of many brilliant receptions, the offices of the Belfast Water Commissioners in Royal Avenue, and the newly constructed Telephone House are but a few among many other buildings which add to the dignity and importance of the city. The huge electricity works at the harbour entrance, the mammoth silo for storing grain the large flour mills, and the magnificent 400 acre aerodrome at which the largest marine and land aircraft can be moored or land are all indications of the up to date outlook of a modern city. Perhaps the ardent motorist may be interested to visit a veterinary establishment in May Street, and to stand upon the very spot and amid the surroundings where J. B. Dunlop conceived the idea of the pneumatic tyre. Here he can picture to himself the scene as the familiar bearded gentleman experienced the thrill of his experiments which have revolutionized transport throughout the world. A simple plaque erected in 1930 records the facts.

JOHN BOYD DUNLOP

Born 5th February 1840 Died 23rd October 1921

MEMBER OF THE ROYAL COLLEGE OF VETERINARY SURGEONS PRACTISING IN THIS CITY INVENTOR AND PATENTEE OF THE PNEUMATIC TYRE IN 1888 THE PURCHASE OF THIS INVENTION AND THE SUBSEQUENT DEVELOPMENT BY THE DUNLOP RUBBER CO. LTD. INAUGURATED ONE OF THE LARGEST INDUSTRIES IN THE WORLD

[The four photographs reproduced are by W. and G. Baird Ltd., Belfast.]

According to a report recently received by the Women's Zionist Organization of America, the mortality among Jewish infants up to 1 year of age in Palestine was reduced in 1935 to nearly half that recorded in 1923.

WATER SUPPLIES AND RIVER POLLUTION

In the annual report of the Water Pollution Research Board issued by the Department of Scientific and Industrial Research (H.M. Stationery Office 1s) it is emphasized that unless satisfactory methods of treatment and disposal of sewage and industrial effluents are more widely adopted there will be considerable difficulty in providing the large volumes of water of good quality necessary for domestic agricultural and industrial purposes.

On the one hand the demand for water of the highest chemical and bacteriological quality is increasing. This increase is due partly to improved conditions of housing with more general provision of public water supplies, baths, modern sanitary appliances and hot water and central heating systems. It is also due partly to the development of modern factories in which large quantities of clean water are used in the manufacture and preparation of beverages, foods and other products under more hygienic conditions. On the other hand recent improvement in the trade of some of the older industries, the introduction of new processes and industries and the development towards centralization in certain industries, particularly those dealing with agricultural products, have increased the quantities of polluting effluents discharged into rivers in many parts of the country. Difficulties which could have been avoided have arisen here and there because in choosing sites and planning factories adequate consideration was not given to the quantity and quality of the water required for the processes nor to the problems of disposal of the waste waters.

The investigations in progress under the Board deal with certain aspects of water supply with methods of treatment and disposal of sewage and trade waste waters, and with problems of river pollution.

Water-softening Materials

Experiments have been continued on the preparation and properties of materials suitable for softening water by the base-exchange process. This process is the basis of the water softeners in use in many households; it is also employed on a large scale by several water supply undertakings. Base-exchange materials on the market include treated minerals and synthetic zeolites. Though some of the synthetic products are made in this country the minerals are all imported. The investigation has shown that satisfactory water softening materials can be prepared from certain British clays and the material prepared from British fuller's earth is in fact superior to the imported treated clays.

Earlier work under the Board had led to the discovery that synthetic resins prepared from phenolic substances and tannins possess marked base-exchange properties and can soften comparatively large quantities of hard water. Unlike synthetic zeolites and treated clays now in commercial use, many of these resins are not detrimentally affected by solutions of acids and alkalis. It had also been discovered that resins possessing acid-exchange properties can be prepared from certain aromatic bases. By treating natural waters first with a base-exchange resin and then with an acid-exchange resin the salts in solution can be wholly removed. These important discoveries have opened a new field of investigation and experiments on the properties of many examples of the resins have been continued.

Lead in Drinking water

The method previously devised as a result of the Board's work for determining the true average concentration of lead in the drinking water withdrawn from a household service over a period of several weeks has been improved. In its improved form it has been tried on household services in several towns. According to this method the water passes through a meter and then through a filter containing magnetic iron and chalk which takes up the whole of the lead from the water. The quantity of lead taken up by the filter can readily be determined by analysis.

Milk Factory Effluents

An outstanding advance has been made in the Board's investigation of methods of purification of waste waters from dairies and milk product factories. Disposal of waste waters from the milk industry without causing serious pollution of rivers and streams or difficulties at sewage disposal works is a problem of great urgency at many dairies and factories. The importance of finding practicable methods of solving the problem is appreciated by the industry. Through the Milk Marketing Boards the industry is co-operating in the work. The experiments already carried out have proved that it is practicable to purify milk washings such as those from milk collecting and distributing depots, creameries and condensed milk factories by the activated sludge process or by biological oxidation in percolating filters operated under certain conditions. Several factories have already installed or are installing purification plants designed on the basis of the information obtained in the investigation. In addition to showing how the waste waters can be purified the investigation has drawn attention to unnecessary losses of milk, cream, buttermilk, skim milk and whey in the wastes.

The report includes a summary of the principal results obtained during the past few years in an investigation of the biology and biochemistry of the activated sludge process of purification of sewage. It also includes the results of recent experiments on physical and chemical aspects of sewage purification.

Nova et Vetera

ANNALS OF MEDICAL HISTORY

The first instalment of the *Annals of Medical History's* second year under the arrangement with Messrs Harper and Brothers contains continuations of two important articles—namely, the fourth part of Dr Joseph Walsh's account of Galen's writings and the influences inspiring them and the second part of 'The Doctor on the Stage: Medicine and Medical Men in Seventeenth Century English Drama'. In the latter article Dr H. Silvette gives many quotations from the dramatists and describes how in *Vulgar Errors* Sir Thomas Browne treated the subject of unicorn's horn with characteristic credulous skepticism. Dr F. Stenn contributes an extremely interesting account of the pioneer history of milk sickness, also called the puking complaint and the trembles, which a century or more ago proved fatal to nearly a quarter of the pioneers and early settlers in North America as well as to large numbers of their cattle. It was shown in 1838 to be due to drinking the milk of cows fed on *Eupatorium agetaroides* or white snake root, the active principle of which tremetol was isolated ninety years later by Couch; this is described as essentially a discovery of a discovery, a truth that is encountered again and again in the metamorphosis of disease.

Among the shorter articles Dr Cornwall deduces from a study of Homer and Aristophanes what the ancient Greeks ate. Dr J. A. Ross writes on the cholera epidemic of 1832 in New York, with copious extracts from Martin Payne's *Letters on the Cholera Asphyxia* as it appeared in the City of New York (1834) and Dr Lyle refers to the famous Daniel Drake as the first medical student of Cincinnati. The portraits of Sir James Paget and Sir Hermann Weber who are mentioned in an article on medical eponyms decorate the cover and the frontispiece. An editorial deals with the war journal of an army surgeon in 1776 and a full review is given of Harvey Cushing's *From a Surgeon's Journal 1915-1918*.

Annals of Medical History, New Series, vol. 9, No. 1, January 1937. Edited by Francis R. Packard, M.D., New York: Paul B. Hoeber, Inc., Medical Book Department of Harper and Brothers, London: Baillière Tindall and Cox. (Pp. 139.) Illustrated. Volume of six numbers £2 10s. Single numbers 10s. 6d.)

THE DIET OF THE PEOPLE

FIRST REPORT OF ADVISORY COMMITTEE ON NUTRITION

Is there sufficient food in this country produced or imported to ensure for everyone a diet in conformity with the principles of modern knowledge?

Are the diets of different sections of the population adequate in every respect in the light of recent advances in the knowledge of nutrition?

Is the state of nutrition (taking the term only in relation to food) of every section as good as it could be made by the application of modern knowledge?

These are the questions to which the Advisory Committee on Nutrition set up by the Government in 1935 addresses itself in its first report.¹ Although the committee, under the chairmanship of Lord Luke, has held forty meetings, it is far from completing its task. Provision is made in the terms of reference for its continuance after 1938, and the present report is little more than an attempt to get the problem into focus.

The issue which the committee has to try is a matter partly of fact and partly of opinion—of fact as to what foods and what amounts of each are consumed and how the total is distributed, and of opinion as to the changes desirable in view of the findings of recent nutritional science. The stimulus to such inquiry comes not from any revelation of widespread malnutrition but on the one hand from the new aspect of the situation which has been opened up by research on food values, and on the other from the revolutionary advances which have been made in production, transport, storage and distribution of foodstuffs. This is believed to be the first occasion in history that a comprehensive survey statistical and physiological, of the diet of a whole nation has been set on foot by any Government.

The Fallacy of Aggregates

This preliminary report naturally begins with some calculations based on national totals of production and consumption. The fundamental unit however, is not the nation but the family. It was the family which was taken in the BMA Committee Report on Nutrition and the future work of the Advisory Committee will be based largely on family budgets and dietary surveys of families. The report does not overstate the case when it declares that it is by no means easy to say what is the total quantity of each food consumed by the population of the United Kingdom. The total quantities of food produced imported and distributed may be worked out and found to be largely in excess of minimum requirements and yet for anything such figures show a large part of the nation might be living under famine conditions.

We are told in this report that the national food supply on the average of the years 1934 and 1935 contained many thousand million calories more than the estimated requirements for the population, it is therefore a reasonable deduction that there is no lack of energy-giving foods in the national supply but that is far from meaning that the entire population is on a proper calorie basis. Similarly, the total protein supplies of animal and vegetable food are estimated at some 300,000 metric tons in excess of the requirements, nevertheless the committee thinks it probable that there is some shortage of this constituent—as also of fat—in the diets of the poorest.

Ministry of Health, Advisory Committee on Nutrition. First Report. London: H.M. Stationery Office (1s net).

A table showing the foodstuffs available for consumption in the United Kingdom, again based on the average of the years 1934 and 1935, is given in the report. We extract the principal items.

	Total 000 Tons	Per Cent Imported	Per Cent Home Produced
Flour	4 427	87	13
Meat (including bacon)	3 062	51	49
Sea fish	953	12	88
Liquid milk (million gallons)	910	—	100
Fruit	2 432	77	23
Potatoes	4 629	3	97
Other vegetables	2 425	25	75
Sugar	1 958	73	27

Fresh milk and potatoes are the only foods produced almost entirely in this country. In terms of energy value or calorie equivalent home production represents about 40 per cent of total consumption, but reckoned in terms of retail value it is estimated that home-produced food is nearly half the total supply.

Individual Consumption

The committee has felt it was no part of its task to show how the changes which it thinks desirable can be brought about by economic or political action. Nevertheless economic considerations dominate the picture. The report is issued at a time of rising bread prices with bread now dearer than at any time since 1925 and it is on bread and flour that the poorer families—those who perhaps are not obtaining the full amount of calories they require—lay out one fifth of their total expenditure on food. The consumption per head of the more expensive foodstuffs, which are those specially important for health—namely, butter, fresh milk, meat, fresh eggs, fruit, and vegetables (other than potatoes)—rises progressively with income, that of the cheaper staple foods such as flour and potatoes, remains nearly constant while the consumption of margarine and condensed milk decreases as income rises.

In addition to spending capacity the choice of food is influenced by questions of age, occupation, habit, locality and not least by personal preference and the amounts consumed are below the amounts provided to an unknown extent owing to wastage in distribution and domestic preparation. Some figures for individual consumption are given, however, which may be useful not for their absolute value but because they can be compared with earlier determinations and thus show tendencies in food selection.

Consumption per Head per Week in United Kingdom	1909-13	1924-28	1934-5
	lb	lb	lb
Cereals including wheat and flour	4.45	4.11	4.04
Meat including poultry etc	2.58	2.56	2.81
Fish	0.79	0.80	0.87
	pts	pts	pts
Milk and cream	3.46	3.35	3.26
	lb	lb	lb
Fruit	1.19	1.75	2.23
Potatoes	4.68	4.43	4.25
Other vegetables	1.38	1.81	2.22
Sugar	1.52	1.60	1.79

The figures for the two earlier periods are the estimates of Sir Alfred Flux, formerly assistant secretary of the statistics department of the Board of Trade. In the first period the Irish Free State was included in the United Kingdom and although of course the necessary correction has been made for the difference in total population, it has not been possible to estimate the effect on consumption habits of the transference of the Irish Free State, a predominantly rural area, from the rest of the country.

The largest proportionate increases since the war have been in condensed milk the consumption of which has increased fourfold—fruit, which has increased by 87 per cent, butter which has increased by 63 per cent and eggs in shell which were consumed to the number of not quite two per head per week before the war, and are now consumed to the number of not quite three per head

Nutritional Needs

The view is taken by the committee that the diet of the people is now more in conformity with physiological principles than it was before the war, one of the reasons for this advance being the educational work on nutrition carried out in health clinics and schools but much remains to be achieved before the general health and physique of the population reaches optimum level. The committee finds itself in general agreement with the Technical Commission appointed by the Health Committee of the League of Nations to define nutritional needs. Three members of that Commission are also members of the Advisory Committee—namely Professor Mellanby its chairman Professor Cathcart, and Sir John Orr. But the Advisory Committee makes certain reservations. It considers that the allowance which the League Commission makes of two grammes of protein per day per kilogramme of body weight for the nursing mother is on the high side and that one and a half grammes would be a more suitable allowance. It also deprecates the irradiation of milk which the Commission appears to recommend or at least not to condemn.

The committee endorses the League Commission's suggestion with regard to the importance of sea fish. For an island people our sea fish consumption is comparatively low less than one third of the consumption of meat. An extended dietary use of the potato is also endorsed for the replacement of part of the sugar and highly milled cereals in the ordinary diet. Potatoes provide extra vitamin C and more readily available calcium and phosphorus than are present in cereals. The present ration of potatoes is 8 oz a day at all income levels; it might well be increased. With regard to sugar it is considered that an excessive amount of sugar is detrimental to the extent that it dulls the appetite for more valuable foods and by leading to a deficient consumption of them may affect nutrition adversely. At the same time there is no quantitative evidence showing what amount of sugar is adequate and what amount is in excess. As for energy and protein foods where the energy content needs to be augmented it is considered preferable to increase the intake of bread rather than of sugar since bread contains some protein appreciable quantities of important minerals and some vitamin B and where the diet is modified by increasing the protein intake in the form of milk, eggs, fish or meat any excess of energy that may result therefrom should be brought down to the standard requirements by reducing the intake of bread and sugar.

The Nutritive Value of Milk

But it is the value of milk that is underlined again and again in this report. The consumption of a sufficient quantity of milk is regarded as the key to proper nutrition. As will be seen from the table given above the milk consumed per head has declined during the last twenty-five years or it is as there is some reason for believing the earlier estimates are unduly high it has remained stationary. The total consumption of liquid milk even adding its equivalent in condensed and dried milk amounts to not more than half a pint per each

person per day—a low figure compared with the estimated milk consumption in some other countries. The requirements suggested by the League Commission are equivalent to a daily allowance of seven eighths of a pint more than double the present consumption of liquid milk.

Incidentally the committee combats the widespread belief that skimmed milk possesses little or no nutritive value. In fact skimmed milk stands next to whole milk in the order of nutritive foods, and differs from it only in so far as it contains very little of the fat with its attendant vitamins A and D. All the remaining materials required for the nutrition of the body—namely protein, carbohydrate, vitamins B, C, and E and inorganic elements—are to be found in skimmed milk, and just as in whole milk, there are left unmentioned nutritionally important physico-chemical and biological characteristics. Unfortunately little of this valuable food is available for sale in liquid form in this country. Some of the skimmed milk produced is dried and sold as such, some is incorporated in foods such as bread, cakes, and confectionery, some is fed to farm animals, and much is wasted. The conditions governing the sale of milk products which render such a highly nutritious food as skimmed milk not readily available to the public cannot be regarded with satisfaction. It is of course not an appropriate food for infants because of the absence of fat with its attendant vitamins, but for all other members of the community it is little inferior to whole milk in a mixed diet if this contains adequate amounts of butter and other fats. In a memorandum published a year ago the committee stressed the need for making milk safe by efficient pasteurization or other heat treatment and it now declares that no other single measure would do more to improve the health development and resistance to disease of the rising generation than a largely increased consumption of safe milk.

Projected Investigations

The committee has studied the various methods which have been tried for the assessment of the nutritional state and finds none of them reliable. The clinical method given in detail in an administrative memorandum of the Board of Education is the most promising. Research should be continued to establish if possible a reliable test or group of tests. It also notes that efforts are being made to remodel diets in Poor Law institutions so as to put in practice modern knowledge of the science of nutrition. Finally it proposes certain further investigations. It recommends that the Ministry of Labour should take steps to obtain further information concerning the distribution of working-class earnings and that the Registrar General be asked to carry out an inquiry into the constitution of families by age, sex, occupation and locality and the distribution of family incomes, also that early steps should be taken to collect family budgets and undertake dietary surveys on a comprehensive scale to show the ratio of food expenditure to total expenditure and the allocation of food expenditure between particular foods. A cognate inquiry will be into the proportion of domestic wastage for each kind of food descending even to such details as the amount given to the cat and dog. In some unpublished results of a dietary survey of fifty families in Newcastle upon Tyne it was found that bones and other portions of meat not eaten amounted to about 10 per cent of the quantity prepared for consumption and inedible portions of potatoes, other vegetables and fish to 20 per cent.

The report contains four appendices. One is a general analysis of the amounts of foods available for home use.

consumption, the second a reproduction of the committee's memorandum issued a year ago on the nutritive value of milk, the third an abstract from the report of the League Commission giving dietary schemes for pregnant and nursing women and for children of various ages, and the fourth an account of some investigations still proceeding with a view to a revision of the conversion factors for meat. This shows so far as it has gone that there is a higher proportion of protein and a lower proportion of fat in the bacon and ham supply of this country than was indicated in earlier analyses, made in 1906 and 1918.

The Ministry of Health has lost no time in taking action on the main recommendation of the report. Maternity and child welfare authorities are being requested to review their arrangements for assuring to pregnant women, nursing mothers, and young children a sufficient supply of milk. Some authorities supply milk to expectant mothers only during the last two or three months of pregnancy, some limit the supply in every case to one pint a day, some only supply milk for children up to the age of 18 months or 2 years. In the interests of the health of mothers and children the Ministry regards it as undesirable to adopt any such limitations. With regard to the recovery of cost from the recipient, the scales should not be such as make it difficult for any mothers to take advantage of the arrangements. It is added that wherever possible efficiently pasteurized milk should be provided and where this is not practicable the medical officer of health should approve the source and quality.

Reports of Societies

NUTRITION AND INFECTIOUS DISEASE

At a meeting of the Section of Comparative Medicine of the Royal Society of Medicine on March 24, with Mr G. W. DUKKIN in the chair, a discussion took place on nutrition and its effect on infectious disease.

Observations on Dietary Habits

Professor S. J. COWELL said that it was notoriously difficult to establish the truth regarding the effect of any individual hygienic factor in health and well-being, one great difficulty being that it was impossible to exclude, in observations on large groups of persons, factors other than the one which was being deliberately varied. While it was the general medical experience that some connexion existed between imperfect nutrition and susceptibility to infectious disease, the actual evidence of the relation of specific variations in diet to changed resistance to infections was extraordinarily conflicting. Attempts had been made to correlate the incidence and course of infections with characteristic or habitual diets used by different races or social classes. The observations of Orr and Gilks on the physique and health of two African tribes which showed that bronchitis, tropical ulcer and malaria were much more common amongst the cereal-eating type than amongst the meat-eating came into this category, but of course the evidence was not conclusive because various social differences came in. Spence of Newcastle had made observations which suggested that bronchitis and pneumonia were something like eight times as common among poor children as among the well-to-do, concluding that faulty nutrition played a part though not the only part in making the poorer children less resistant to respiratory infections. On the other hand, McGonigle of Stockton-on-Tees had not been able to correlate definitely the incidence of respiratory infections with poorer quality of diet. Fried at Christ's Hospital had

been able to show some connexion between infections of the skin and the amount of carbohydrate in the diet. But in all these cases many social, racial and environmental factors must enter, as well as dietary habits.

A second type of observation was to determine the effect of changes in the diet of a population or isolated sections of it on the incidence of infectious diseases. There seemed a fair measure of agreement that the increased incidence of tuberculosis in Central European countries towards the end of the great war was due in great measure to severe quantitative and qualitative restrictions on food. On the other hand, the great influenza epidemic of 1918-19 appeared to ravage the comparatively well-fed troops as much as the less well-fed civil populations. An attempt had also been made to define the part played by food constituents in determining resistance. Severe degrees of deficiency in vitamin A in laboratory animals were practically always associated with bacterial invasion. But when an investigation was made to show whether additional supplies of this vitamin could confer increased resistance to infection on individuals whose diets were not deficient the results were on the whole negative. Two such investigations with which he had been associated—one to discover the effect on the winter sickness rate in one of the Services of giving supplements of vitamin A concentrate, and the other to determine whether there was a lessened incidence of otitis media as a complication of scarlet fever after giving the same concentrate—had shown no dramatic positive results. As for vitamin D, it was probably true that children with active rickets succumbed more readily to pneumonia than others, but this might be explained by the mechanical resistance to respiration offered by the deformed chest wall. There was some evidence that vitamin C played an important part in protecting guinea-pigs against tuberculosis, but the results in human beings had been indecisive. It had been suggested that rheumatic lesions might be caused by vitamin C deficiency together with some specific bacterial infection, but this had not so far been substantiated by observation on children.

Altogether it was exceedingly difficult to prove the relation of any food factor to resistance to infection. One was left with the feeling that in so far as the state of nutrition was connected with resistance to infection, the connexion was that nutrition might determine the course an infection would rather take than decide whether infection would occur. The evidence available in the case of man did not seem to warrant the view that one isolated food constituent was responsible for maintaining the resistance of the body to infection in any general sense. On the other hand, there was suggestive evidence that gross malnutrition or a state of definite food deficiency might lower the resistance to established infections. The possibility had to be considered that in optimum state of nutrition lasting for a longer time in the life of an individual than in most of the tests so far reported might be necessary to secure the maximum degree of resistance.

Anti-infective Factors in Diet

Miss HARRIETTE CHICK, D.Sc., said that although there was a very general feeling that the state of nutrition must influence the degree and course of infection, and even susceptibility to it, this was difficult to prove on the human level. Infection was influenced by (1) the nutritive state of the subject, (2) other conditions such as chill, fatigue and anxiety, (3) the degree of infection, and (4) the virulence of infection—and (2), (3) and (4) might have as great an influence as or greater than (1). In an acute disease (1) could hardly be expected to have any influence, but in a slow chronic infection taking a much longer time to get started (2), (3) and (4) would remain fairly constant over a long period but (1) would eventually become more important. An influenza or measles epidemic would run through a public school as devastatingly as through an elementary school, where the feeding and other conditions of the children might be

inferior. The higher mortality and incidence of pneumonia in the 1918-19 influenza epidemic might have been due to the fact that the population was in a poorer state of nutrition. In the recent influenza epidemic there was nothing like the same disastrous effects or high incidence of pneumonia. In the slower and more chronic type of infection proof could be seen of the influence of nutrition. Many years ago it was a common thing to see children in Poor Law schools suffering from infective conjunctivitis, due to the low level of diet prevailing. With regard to tuberculosis she had compared for one pre-war and four war years the mortality in Vienna, which suffered greatly from malnutrition soon after the war started with that in the province of Salzburg which did not suffer to anything like the same extent.

	Vienna		Salzburg	
	Deaths from tuberculosis	Per 1 000	Deaths from tuberculosis	Per 1 000
1913	5,957	3.0	527	2.4
1915	6,873	3.4	539	2.5
1917	8,548	4.2	549	2.5
1918	11,531	—	588	2.7
1919	11,490	—	670	—

Turning to experimental work, where other variables could be removed, she thought that any essential dietetic factor could be an anti-infective factor. In severe vitamin A deficiency the fact that so many infections were obtained with laboratory animals was due to structural defect, which made its appearance with the deficiency—the mucous membrane became unhealthy, and it was by way of the mucous membrane, especially of the respiratory tract, that most infections took root. She described a series of experiments not yet published which had been performed in the Department of Experimental Pathology at Cambridge with a view to investigating the nutritive defects of maize, the idea being to arrive at some knowledge of the aetiology of human pellagra in populations subsisting very largely on that cereal. Litters of pigs were fed on three diets, one of which consisted of 83 per cent. of maize, while in the second a mixture of wheat and barley was substituted for the maize, and in the third the maize was restored but 8 per cent. of yeast was added. The pigs receiving the first diet became very sick in about six weeks with a lowered haemoglobin content, anaemia, diarrhoea, and great loss of weight, dying in about eight or nine weeks if the diet was not changed. At post-mortem they were found to have a very inflamed caecum and ulcerated colon. All the animals had what the veterinary specialists described as necrotic enteritis, but all attempts to isolate pathogenic organisms in the blood or stools failed. The group fed on the second diet also showed diarrhoea and several died, but the third group which had had yeast from the start showed no sign of diarrhoea and prospered, the yeast apparently making the imperfect diet right and very nutritive for these pigs. Other experiments had shown that the factor in the yeast which made the maize diet wholesome was a water-soluble extract of the yeast which was heat stable.

Vitamin C and Resistance to Infection

Dr LESLIE HARRIS dealt with the relation between vitamin C and infection. He had first become interested in this relation by reason of some observations he had made on the excretion of vitamin C by normal control subjects. It was found that the amount excreted in the urine suddenly dropped when any of the subjects had a feverish cold or an attack of influenza and this diminished excretion of vitamin C ran parallel with the infection. It appeared as if in an acute infection the body reserves of vitamin C became depleted. It seemed proved that vitamin C was concerned—with other factors no doubt—in increasing resistance to infection though it was not determined whether this deficiency was the result of the fever or the cause. In some observations on cases of osteomyelitis while the controls excreted the standard amount of vitamin C every day, the acute case excreted

only half the amount. In active cases of phthisis very little vitamin C was excreted and one could go on giving repeated test doses over a long period before it appeared in the urine. With recovery the patient became better saturated. Some experiments had been done on rats showing again that animals with various infections including diphtheria, had smaller reserves of vitamin C post-mortem than controls fed on the same diet. There appeared to be an increased usage of vitamin C in infections. Vitamin C was needed for formative cells—osteoblasts, odontoblasts and new tissues such as scar tissue—it also stimulated the reticulocyte response. There was very little conclusive evidence that vitamin C would help once an acute infection had started, but the prospect in prophylaxis was more hopeful.

Nutrition and Infection in Animals

Dr J. T. EDWARDS presented a short summary of work done on the relationship of nutrition to foot and mouth disease. Experiments on small animals—rats and hedgehogs—confirmed the observations of others that foot and mouth disease infection was most severe in animals that were well grown and well nourished. In fact the animals which appeared to be most susceptible were those in prime condition and in the prime of life. Rats fed on a theoretically complete diet (diet N of Korenschewsky) had been compared with an underfed group fed on bread and milk. All the rats were afterwards inoculated in the skin of the hind foot with the virus of foot and mouth disease. The conclusions were opposed to much current opinion regarding infectious disease in general. The view commonly held and apparently more widely applicable was that low physical condition as in the undernourished made them an easy prey to infection. But in these experiments it was the properly fed animals which developed the infection more strikingly. Similar experimental work had not yet been carried out upon the larger naturally susceptible animals but for some time it had been the common experience in research laboratories that when cattle and the other larger animals were in low condition they did not react well to inoculation with the virus. The records of field observations in temperate countries gave little information upon the relationship under discussion though it was often observed by veterinary surgeons who had to deal with tuberculosis that high class stock fed and kept in the best conditions suffered more severely than lean beasts when disease was allowed to run its course. Strong well-grown cattle were more susceptible to blackleg and anthrax and perhaps the same was true of sheep in their susceptibility to braxy. Whether any component of the diet was particularly concerned in causing increased susceptibility to foot and mouth disease infection had not been determined. The addition of raw liver and carrot to the poor (bread and milk) diet produced a distinct increase in susceptibility in rats probably because it prevented the occurrence of anaemia which was associated as a very constant symptom with the decreased susceptibility to foot and mouth disease among the animals on a poor diet. The impression gained from observations upon the smaller animals was that susceptibility to infection was influenced not so much by any specific ingredient in the diet as by the degree to which nourishment promoted the metabolism generally in the animal body. One curious thing noted was a decrease in the metabolic needs of the sexes. A diet adequate for the female was found to be inadequate for the male. When rats were placed on a good diet after a period of underfeeding the males showed an increased susceptibility to infection within five days, in females the response was slower. Dr Edwards suggested that the greater rapacity of males and the greater fastidiousness of females might have something to do with this.

Conflicting Evidence

Dr H. H. GREEN spoke on the influence of diet on bacterial infections. It was generally believed that mal-

nutrition predisposed to such infections though much of the evidence was indirect and confusing. Some observations in the Transvaal, where much of the vegetation was deficient in phosphorus had shown that sheep suffering from phosphorus deficiency suffered also more from worm infestation than sheep which received a supplementary dose of phosphorus. In the case of organisms of high virulence food deficiency did not seem to make any difference. Thus a disease like swine fever had the same incidence in animals badly or well nourished. Dr DAGMAR WILSON mentioned certain experiments among children in the Punjab which had shown no close connexion between vitamin deficiency disease and malaria.

Dr H WARREN CROWE referred to an experimental production of arthritis in rabbits by the injection of streptococci. It was suggested to him that the results would be even more striking if the rabbits were fed on a non-vitamin diet. Accordingly a cereal was used which was superheated by steam and the rabbits became avitaminosed but on injecting them with streptococci which were known to produce arthritis the rabbits on the non vitamin dietary did not broadly speaking, develop arthritis at all. The explanation which his clinical work suggested was that arthritis or rheumatism was a disease of reaction of the tissues the tissues reacting against some noxious influence, and tissues which were weakened would not react. It was also shown that patients who were in bed, undernourished and anaemic with a high blood sedimentation rate did not suffer severe pain with their arthritis but when their general health improved the pain was much worse. The 1918 influenza epidemic had been mentioned, but it was a mistake to suppose that that was worse because of prevailing malnutrition. The old creaking gates at home did not die to the same extent as officers and men in the trenches who were fighting fit. That was because the latter reacted so tremendously to a highly virulent organism.

Mr A L BACHARACH said that if the correctness of Dr Chick's general observation that all the so called minor constituents of diet might play an anti infective part were assumed it must be remembered that the total of their collective action was not a sum but an integration and it was quite possible to be misled, as had often happened in the laboratory by inability to control that fact. It was conceivable that the response to an organism might be lowered by the absence of two or more factors but that the effect of the absence of Y was so immediate that no amount of Z added would produce any effect at all. He had the impression from examining some of the studies made in which specific constituents had been added to the diet of groups of experimental subjects that were obviously undernourished in more than one direction that only a purely negative conclusion could be drawn from the results. This was because account had not been taken of the integrated effect of all the necessary factors in the diet. With regard to the question raised by Dr Harris there were other conditions besides those he had mentioned not ordinarily to be regarded as pathological in which there was a very marked depletion of vitamin C storage certainly a typical situation. One of these was benzene poisoning and others were pregnancy and lactation. It seemed to him possible that the benefit from the administration of ascorbic acid in febrile and possibly other conditions was not to be shown by its effect on those conditions at all. If one of the functions of ascorbic acid as such was that it acted very much more vigorously during febrile and certain other conditions and so got depleted it became necessary to build up the reserves not in order to deal with the particular condition associated with the depletion but as a kind of insurance policy against that or any other condition the next time it arose. Dr LESLIE HARRIS said that while it was uncertain whether low reserves of vitamin A as of other vitamins were a cause or a result of infection it did appear that in certain diseased states there was faulty preservation and use of vitamin A.

FULL-TERM EXTRA-UTERINE PREGNANCY

At a meeting of the North of England Obstetrical and Gynaecological Society on February 26 Dr F J BURKE of Liverpool reported two cases of full term extra uterine pregnancy.

The patient aged 45 was admitted to hospital with severe abdominal pain. Her last menstrual period seven months previously was followed a month later by an attack of abdominal pain with retention of urine. The local distension subsided but the abdomen became progressively enlarged. When she was admitted to hospital the abdominal tumour was as large as a full term pregnancy with a firm hard and rounded mass on its right. Radiography revealed a single large foetus presenting by the vertex. Extra uterine pregnancy was diagnosed and laparotomy was performed. The omentum was adherent to the anterior abdominal wall. The presenting mass was incised, foul liquor amnii escaped and a macerated foetus was extracted. Exploration of the left broad ligament revealed a gestation sac with a large piece of degenerated placenta. This was removed without haemorrhage and the remainder of the placenta was left in position the sac being marsupialized. The patient died one hour later and necropsy showed that there had been profuse haemorrhage into the gestation sac. The macerated foetus weighed 51 lb but had no congenital deformities.

The second patient was a primipara aged 27 when she first attended the ante natal clinic the abdominal tumour corresponded in size to that associated with the period of amenorrhoea. It became evident later that the pregnancy was abnormal and at the thirty fourth week a large foetal head was found to be firmly fixed in the right upper pole. She was admitted to hospital with a brownish vaginal discharge. The foetal heart sound could not be heard and foetal death was confirmed later by radiography. Extra uterine pregnancy was suspected and laparotomy was performed a macerated foetus being removed from a transparent sac. The placenta was lying on top of the uterus but was connected with it only by a thin pedicle. This was divided the abdomen was closed and the patient made an uneventful recovery. The pedicle was found to be a small uterine horn. The foetus weighed 5 lb it was a case of talipes equinovarus.

Mr MILES H PHILLIPS (Sheffield) said that in his experience the management of the placenta was the important point at the operation. He thought it best left alone. He had had six cases one of which had a subsequent laparotomy for another condition only a few adhesions were then found. Dr R NEWTON (Manchester) questioned the advisability of taking no action if the foetus were dead. Mr J ST GEORGE WILSON (Liverpool) showed an x ray film of a woman aged 80 who had died from a broken femur. In the abdomen was a large calcified foetus. Dr J H WILLET (Liverpool) condemned free exploration of the abdomen owing to the risk of severe haemorrhage from the separation of the placenta. Surgical intervention should take place at once when the foetal heart had stopped. Professor FITCHER SHAW (Manchester) mentioned a personal case in which a living foetus had been removed.

Dr BURKE in reply said he thought that his first patient would have died from septicæmia if no operation had been performed. In both his cases there had been diagnostic difficulty, since no foetal limbs could be felt.

Varicocele in the Female

Professor W FLETCHER SHAW (Manchester) read a short paper on this condition and reported six cases. He said that while all textbooks mentioned this condition not one gave a satisfactory account. Emge had attributed it to damage to the fibro-elastic suspensory mainly only a small amount of the lesion being due to changes in the walls of the veins. Carlos Castano had described it as the disease with the most marked subjective and the fewest objective symptoms. Graves had mentioned that it was often erroneously diagnosed as inflammatory adnexal

disease. The speaker's attention had first been directed to this condition by the late Dr W. E. Fothergill in 1921 and he had at the outset been rather sceptical about the essential nature of a complaint which could only be recognized when the patient was in the erect position, but in 1923 he had had three cases in one month.

An unmarried woman aged 26 with dysmenorrhoea, menorrhagia, and backache had been cured by him in 1922 and had had a laparotomy in 1923 because of suspected chronic salpingitis. He had found however a mass of veins in the left broad ligament which had been ligatured and excised. A year later severe right-sided abdominal pain had necessitated a second opening of the abdomen when the right ovary was found to be cystic and there was a mass of veins in the right broad ligament. The right tube and ovary were removed with this mass; the patient recovered completely and had a family.

A primipara aged 31 had aching pains in both iliac regions and a matted left appendix was diagnosed. A mass of veins was removed from the left side but one year later the symptoms had returned. A similar mass of veins was then removed from the right broad ligament and panhysterectomy was performed.

An unmarried woman aged 35 had had recurrent acute abdominal pains; the uterus was ante-flexed and there was a mass felt on its right side. A matted left appendix was diagnosed but at the operation a mass of veins had been ligatured and excised and the patient had had no further trouble.

Professor Fletcher Shaw remarked that some writers had stated that retroflexion was a probable cause of this condition but in only one of these three cases had a retroflexed uterus been found. Pressure on the left broad ligament by the sigmoid flexure or rectum seemed to be a factor. In 1924 he had had two further cases.

A married woman aged 40 who had given birth to two children complained of pain in the left iliac fossa; a mass was felt on this side and was diagnosed as a matted appendage. On laparotomy a mass of veins was removed with the left tube and ovary. Recovery followed.

A primipara aged 29 had had a left oophorectomy one year previously. She had aching pain on the left side where a tender mass was felt. The left broad ligament contained a mass of large veins and hysterectomy was performed.

After an interval of fifteen years Professor Fletcher Shaw had now seen another case.

A married woman aged 42 with three children had complained of severe pain in the right iliac fossa; no operation was undertaken but five years later the pain had continued and a mass was felt in the pelvis suggesting a fibroid. A large mass of distended veins was found on operation in each broad ligament. Supravaginal hysterectomy was performed and both appendages were removed with consequent return of good health.

Professor Fletcher Shaw said that in each of these cases the mass was large enough to suggest the presence of a pelvic tumour. In five instances the pain was left-sided. In the first three cases he had excised the veins without curing the patients but in the others a more drastic procedure had proved successful. The aetiology of this condition was obscure; retroflexion was present in only one of the cases and there was no marked laxity of the pelvic floor. He thought that the condition was more common than was generally supposed and that the treatment usually tried was unsatisfactory.

Mr J. E. STACEY (Sheffield) agreed that the condition was very common and attributed it to coitus interruptus. Examination of the patient in the erect position was essential to correct diagnosis. Only hysterectomy would cure a severe case. Mr T. F. TODD (Manchester) thought that these cases were due to unsatisfactory sex life. Mr MILES PHILLIPS said it was noteworthy that the patient complained of the pain when stepping out of bed. He had rarely excised the veins in older women with any prelude; he performed vaginal hysterectomy. Professor FLETCHER SHAW

replied that he doubted whether coitus interruptus was the main aetiological factor, two of his first three patients had had no coitus.

Locked Twins

Dr W. S. WRIGHT (Stoke-on-Trent) showed a case of locked twins, and discussed the aetiology.

A primigravida aged 21 at the thirty-eighth week of pregnancy had a uterus the size of which was that of full term. The presenting foetal part was in the breech. The external pelvic measurements were large. Radiographic examination revealed a twin pregnancy: the first foetus presenting by the breech and the second by the vertex. Labour followed the morning after admission into hospital; the buttocks of the first foetus being born and expulsion continuing naturally as far as the umbilicus when the circulation in the cord stopped and traction was unsuccessful. The chin of the first foetus was found to have locked with that of the second, both heads being firmly wedged in the lower uterine segment. The chins could not be freed and the first one was eviscerated and decapitated; the floating head being pressed back into the uterus. The second foetus was then delivered with forceps without difficulty; it was in a state of white asphyxia and did not recover. The head of the first foetus was next delivered by a vulsellum. The placenta of the fused binovular variety was expelled eight minutes later. The patient was in excellent condition after the operation, had an uneventful puerperium and was discharged on the twelfth day.

Dr Wright said that von Braun had estimated the frequency of locking as 1 in 90,000. It might occur in four ways: (1) both foetuses presented by the vertices entered the pelvis side by side and became arrested; (2) the first child presented by the breech and the second by the vertex, the chins locking; (3) the first child presenting by the breech might become locked by the chin on the body of the second foetus lying transversely; (4) both foetuses presenting by the feet might enter the pelvis together. Mr MILES PHILLIPS thought that a possible cause for such interlocking was a deficiency of liquor amnii. Dr MARSHALL (Liverpool) said that for purposes of decapitation a saw could be passed round the foetal neck with the thumb and forefinger using a Blond Heidler thimble.

Malignant Tumours in a Child

The president Dr J. W. BRIDE (Manchester) showed specimens of malignant tumours of the right ovary and left lung in a girl aged 12.

For some months she had had loss of weight and a rapidly swelling abdomen followed by pain in the left side of the chest, cough and slightly blood-stained sputum. Menstruation had not commenced. The abdomen was found to be filled by a painful and cystic tumour and the diagnosis seemed to lie between tuberculous ascites with pleurisy and an ovarian dermoid or sarcoma. A soft ovarian tumour the size of a football was removed without difficulty and the patient was much relieved but died on the eleventh day after admission to hospital from profuse haemoptysis. The ovarian tumour was encapsulated, lobulated and semi-solid; it had a white brain-like appearance with a number of cystic areas. The left lung showed many hard, irregular and raised nodules, two of which had almost penetrated the pleura and were invaded by haemorrhage. The secondary processes had spread throughout the lung. One ovarian tumour section revealed fibrous tissue mixed type cellular elements; considerable variation in the size and shape of the cells and nuclei and mitosis. The second section taken from the centre of the tumour suggested the appearance of a cystadenoma owing to the presence of glandular spaces. The main structure was, however, definitely fibrous with cells similar to those in the first section. A section of a lung nodule showed cellular elements of a mixed type, small and large brown cells being seen with multinucleated cells. Mitosis was present and there was much haemorrhage and necrotic invasion.

Dr BRIDE thought that this was a case of a multicellular sarcoma of the ovary with secondary deposit in the lung.

He referred to the series of ovarian tumours in girls under the age of 15 which had been collected by Bland Sutton and to the case recorded by S B Hurd who had removed at necropsy a round-celled ovarian sarcoma from a girl aged 17. Dr Bride added that sarcomata occurred much earlier in life than did carcinomata, most being detected at the age of puberty. They were usually bilateral, round-celled and extremely malignant. Solid ovarian teratomata contained embryonic tissues from all the layers of the blastocyst; they were often malignant, with sarcomatous metastases. Chorion epithelioma of the ovary might represent a form of teratoma.

The Interposition Operation

Mr J ST GEORGE WILSON (Liverpool) who showed an illustrative cinematograph film said that the interposition operation was specially indicated in the case of patients with a large cystocele which was difficult to cure by Fothergill's operation without undue narrowing of the vagina resulting. A second important indication was that the patient must have passed the menopause. If the cervix was elongated it should be amputated in the usual way. The technique of the operation was that described and practised by the late Professor Blair Bell.

Professor FLETCHER SHAW thought that a reasonable criticism of the operation was that after it had been completed the cervix could still be pulled down to the vulva. The operation must be restricted absolutely to post-menopausal cases. Dr S B HURD (Liverpool) defined two indications for the operation: a previous failure with colporrhaphy and the presence of a retroflexed uterus needing suspension. He had experienced more difficulty with metrorrhagia in his cases after this operation than after colporrhaphy. Mr J E STACEY reported that he had known pregnancy to occur after the operation but Caesarean section had been necessary for delivery. Mr W GOUGH (Leeds) stated that he had seen one case of carcinoma of the body of the uterus after this operation. Mr ST GEORGE WILSON added that a bulky uterus constituted a contraindication. Even with a small uterus this operation was useful since cystocele was the main trouble in most cases and the technique which had been indicated obviated making the vagina too small. He always amputated the cervix in these cases.

Mucocoele of the Appendix

Mr J W BURNS (Liverpool) showed a case of mucocoele of the appendix in a woman aged 42, the only clinical symptom of which had been a feeling of stretching in the right side. There was a sausage-shaped tumour in the right iliac fossa on the outer side of the caecum from which it had become sealed off. It was filled with translucent fluid. Mr Burns stated that great care had been taken during the operation to avoid rupturing the cyst. He thought that if this had occurred a general pseudo-myxoma peritonii would have ensued with the appendix as the original focus. Dr BRIDE remarked that so large a mucocoele (7 by 3 by 2 inches) must be very rare and raised the question whether there was any connexion between pseudo-myxoma peritonii and mucocoele of the appendix.

TRAUMATIC RADIAL PARALYSIS

A meeting of the Royal Medico-Chirurgical Society of Glasgow was held on March 19 when the president Mr GEORGE H. EMMERTON showed a case in which the radial nerve was operated on two years ago for traumatic (fracture) paralysis.

A schoolboy aged 14 had been admitted to his ward in the Western Infirmary on January 2, 1935 with a fracture of the middle of the shaft of the right humerus due to his

having been knocked down by a motor car a few hours previously. Examination on the following day showed marked musculo-spiral paralysis. The fracture united and he was discharged in a splint. Two months later the paralysis had not improved and on March 28 the radial nerve was exposed through a lateral incision and was found to be nipped between the fragments of the bone. The nerve was divided and freed above and below the fracture through a medial incision. The proximal part was displaced to the front of the arm (as recommended by Stiles) and was sutured to the distal part under cover of the brachialis anticus. Recovery of power was very slow when the boy was seen towards the end of July 1935 there was little if any chance and electrical testing of the muscles involved showed no response to the faradic and weak to the galvanic current. Early in October 1936 he had recovered fair use of the hand and arm. The limb was much thinner than its fellow. Paralysis of the extensor ossis metacarpi and the primi internodii pollicis was noted. By the middle of February 1937 power was greater; he was able to play ping-pong but doubted his ability for tennis. If he tried to manipulate a heavy object a train was felt at the wrist. Thumb paralysis persisted and extension of the metacarpo-phalangeal joint of the index finger was not so complete as in the left hand. Numbness was present down the radial side of the second metacarpal and index and more slightly on the adjacent side of the thumb and first metacarpal.

The points illustrated by the case were as follows: Diagnosis of the precise cause of the paralysis had not been made out before the operation. There had been slow recovery of power. There was still persistence of implication of the deep extensors.

Hip Lesions

Mr ALEXANDER MILLER discussed lesions of the hip and their treatment considered under a clinical classification with lantern slides illustrating the primary and secondary deformities encountered from lesions in this region. He said that aetiological and prognostical controversy existed with regard to certain stages of hip disease and the diagnosis was only established in doubtful or early cases by a careful observation and follow-up. The term toxic arthritis was reserved for cases manifesting the hip joint syndrome which following rest and extension cleared up with neither clinical nor radiological evidence of disease. The classification adopted was: (1) toxic arthritis, (2) tuberculous disease, (3) infective arthritis (now tuberculous), (4) pseudo-coxalgia, (5) traumatic and (6) flail-hip. In treatment the relative values of manipulation, extra and intra-articular arthrodesis and osteotomy were considered, and examples of each were illustrated.

Rapid Histology in Diagnosis

Mr G T MORAT discussed cases in which errors of diagnosis as to malignancy or otherwise had been made at the time of operation. In some instances radical operations had been performed and had subsequently proved unnecessary while in others malignant tissue had been incised and an interval had been allowed to elapse while a paraffin section was being made before adequate treatment was instituted. Results from experience in the Glasgow Royal Cancer Hospital of a system of quick histological examination were discussed. In most of the cases definite information had been obtained while in a minority an intelligent lead had been given to the surgeon. Routine paraffin sections showed that in no case had the diagnosis of malignancy or otherwise to be revised. It was found most helpful in doubtful breast cases but was also used in lesions of the gastro-intestinal tract and the oropharynx. In suspected carcinoma of the body of the uterus curettage scrapings were successfully used for diagnosis. The chief methods used were the frozen section, the Dudgeon and Patrick method and the ultrapak illuminator. The average time taken for diagnosis was five minutes. The results left little doubt as to the general efficiency of the methods or of the practical help given to the surgeon.

Hyperthyroidism and the Basal Metabolism

Dr A B ANDERSON discussed the relation of the basal metabolism to the clinical signs of hyperthyroidism. In a series of 140 patients of various ages and both sexes who were clinically hyperthyroid or were suspected of hyperthyroidism the basal metabolic rate had been compared with the occurrence of the clinical signs: enlargement of the thyroid, exophthalmos, tremor, tachycardia, sweating and loss of weight. The tentative conclusions reached were as follows. When enlargement of the thyroid was accompanied by exophthalmos or any other of the clinical signs the basal metabolic rate would be high in nearly all cases. When enlargement of the thyroid was not accompanied by exophthalmos but all the other signs were present the basal metabolic rate would be high in nearly all cases but when only two or three signs were present the rate would be normal in a number of cases. When enlargement of the thyroid was present alone or with only one other sign the rate would be normal. In cases of tachycardia without enlargement of the thyroid gland the rate would be normal in nearly all cases.

SEDIMENTATION RATES IN RHEUMATOID ARTHRITIS

A meeting of the Committee for the Study and Investigation of Rheumatism took place at the Red Cross Clinic, Peto Place W1, on February 9, with Dr FRANK HOWITT in the chair. Dr LESTRANGE ORME opened a discussion on sedimentation rates in rheumatoid arthritis.

Dr Orme drew attention to the vast amount of material available at the Clinic and the information that could be obtained by a comparison of sedimentation estimations from such a variety of cases. He compared the regular estimation of rates in chronic disease with the temperature readings in acute conditions. Both were valuable indices of the severity of the infection, the progress under treatment, and the probable prognosis but such observations must be compared with the clinical condition and too much attention should not be paid to minor variations. He did not think that more valuable information would be obtained by increasing the complexity or accuracy of the test. He preferred the standard Westergren technique as being in more general use and giving fully as accurate conclusions as the biological basis of the test warranted. Sedimentation curves were shown from a number of cases under treatment at the Clinic: these had been automatically recorded by the photographic method devised by Dr Shackle. Attention was drawn to the characteristic shape of these curves and also to the secondary sedimentation (revealed by the photographic method) of the opalescent particles in the serum. The significance of this was not known but it was interesting to note that it did not run parallel with the sedimentation of the blood cells thus indicating that suspension stability was not merely a question of specific gravity. A series of estimations extending over several years was reported in one or two severe cases of rheumatoid arthritis. A very chronic course and slow response to treatment was indicated when the rate was over 50 mm in the first hour; the rate remained remarkably constant in such cases for two or more years. There was very close correlation between the sedimentation rates and such x-ray evidence as de calcification where both had been available regularly during the course of the disease. The curves of a number of rheumatoid patients who had responded well to gold therapy were shown. The most favourable rate for treatment seemed to be 15 to 25 mm in the first hour but good results were sometimes obtained with higher rates. The sedimentation rate returned to normal more slowly than the patient's clinical condition improved. Normal curves were always found in neuritis and fibrositis but one rapid curve was shown in connexion with a case sent

up as lumbar fibrositis but which on investigation proved to be a secondary carcinoma of the spine. A rapid curve in such a case would give rise to suspicion even in the absence of any physical signs of bone disease. Curves were also shown from cases of infective arthritis and gout.

Dr J W SHACKLE asked for helpful suggestions with regard to the nature of the secondary curve and also as to the sedimentation of opalescent bodies at a much slower rate than the red corpuscles. He questioned whether corpuscles ever did really "pack down" and described an experiment made with talc when he found that this substance went right through the red corpuscles which settled, but never really "packed down" on the top. His main question was: What caused apparent packing? Dr M B RAY criticized the technique and expressed the general opinion that at best the experiment was messy, capable of wide margins of error and dependent on the types of tubes employed. Dr FRANK COKE agreed that the test was not simple. In a general way it was capable of yielding misleading results with quite small variation of the angle at which the Westergren drop tube was held. The most intriguing problem was why the drops showed changes in the blood. He had recently discovered a protein larger than fibrin particles, which might account for the secondary curve. Differential diagnosis between rheumatoid or infective arthritis could not be based on the sedimentation rates. Every worker in this field should use the same apparatus if comparative data of any value were to emerge.

Dr W S C COPEMAN raised the question of the sedimentation rate of tungstic acid in various strengths and Dr COKE replied that tungstic molybdic and vanadic acids were the most easily standardized. His method was to record an acidity curve of twenty-four hours of the vanadic acid and serum reaction. The difference between the heated and the unheated curve gave a marked indication of the patient's response to treatment, implying the patient's general resistance. This test differentiated between the osteoarthritic and rheumatoid groups of cases. Dr GILBERT SCOTT pleaded that only cases showing decalcification should be labelled rheumatoid. He demonstrated some charts of Dr Coke's vanadic acid test which were intended to display the clinical progress of cases under treatment.

ENDOMETRIOSIS

A meeting of the Section of Obstetrics of the Royal Academy of Medicine in Ireland was held on February 26 with the president Dr J F CUNNINGHAM in the chair.

Dr N M FALKNER showed a case of multiple fibroids associated with pregnancy. X-ray examination had not shown any evidence of pregnancy although there was a history of three months amenorrhoea. A subtotal hysterectomy was done and the specimen was found to have a foetus inside it; both ovaries were removed. Dr Falkner next showed specimens from a case of early ovarian endometrioma. He outlined the views of Sampson, Everett and Novak on the origin of endometriosis. Everett had suggested a tubal origin while Novak and Meyer believed that the condition arose as a result of serosal heteroplasia. The fact that the lining mucous membrane of the tubes, uterus and vagina were all derived from the coelomic epithelium supported this view. Dr Falkner suggested that there were deficiencies both in Sampson's original theory and in the view put forward by Novak. In the first there must be some added factor causing the endometrial fragments to implant and in the second there was no explanation of what stimulated the heteroplasia. It was possible however that scattered areas of the pelvic peritoneum possessed special sensitivity to ovarian influence since islands of decidua were known to appear on the posterior surface of the uterus and broad ligaments. The case Dr Falkner described was that of a woman aged 26.

She had been married for eight years and had had three children and no miscarriages. Her last pregnancy had been five years previously. She complained of loss of weight over a period of three months and pain in the left side. Her menstrual periods were normal and there was no intermenstrual discharge. On examination the cervix was found to be torn and rather hypertrophied. The uterus was retroverted and there was some tenderness in the region of the left ovary. At operation a Gilliam suspension was done and both ovaries were found to have small purple blob like structures on their surfaces. These were easily wiped off and a small wedge of the left ovary was resected.

Encysted Endometrioma

Dr J F CUNNINGHAM, the Master of the National Maternity Hospital showed an encysted endometrioma of the broad ligament. The patient was aged 41, and had been married for seven years.

Before marriage her health had been good and she had not had any serious illness. Her menstrual history had been normal. After marriage she had had three normal deliveries at term, the most recent one being some two years previously. For the past twelve months she had had pain in the region of the left groin and in the sacrum with a sensation of pressure in the pelvis. The pain was not severe but became worse during menstruation. There was a slight non-purulent leucorrhoea.

On examination the cervix was thickened and showed some shallow laceration. The uterus was small retroverted and lying in the right side of the pelvis. Through the left lateral fornix a tense cystic swelling as large as a tangerine orange could be felt in the base of the left broad ligament. It did not bulge into the vagina. At operation a radial incision was made through the vaginal wall in the left posterolateral fornix. The cyst was under considerable tension and contained a quantity of dark red fluid. On exploring the cavity it was found to be in the lower part of the left broad ligament below the level of the uterine vessels. It had no connexion with the peritoneal cavity or with the cervical canal or the uterine cavity. A soft mass was felt in the cyst and on removal presented the appearance of a mucous polypus. The report of this specimen was:

This specimen was a mass of tissue about the size of a walnut containing several small cystic cavities. Sections prepared from it show a stroma of fibro-connective tissue containing numerous glandular remnants many of which were dilated. There is some infiltration with chronic inflammatory cells more especially near surface. The specimen is a mucous polypus. The epithelium is columnar. There is no evidence of the presence of placental remnants.

The cavity in which this was found however contained some old blood which was not clotted. Dr Cunningham said that he believed the specimen to be an endometrioma encysted in the base of the left broad ligament. In the discussion which followed Dr A H DAVIDSON, the Master of the Rotunda Hospital said that cases of endometrioma were few and in the last year he had only seen one. Dr C C DOCKERTY said it was interesting to note that in India for instance far more cases of this condition were seen than in Ireland. In some of the cases there was an associated salpingo-oophoritis and he thought that where this existed a leucocyte count might be of value. In replying to the discussion Dr FALKNER said that he wondered whether endometriosis might not be due to gynaecological procedures such as dilating the tubes. He thought there was no doubt that sterility and endometriomata were associated. A few cases would respond to conservative surgery but in most instances cure could be achieved only by removing the endometrium or the uterus or else by producing an artificial menopause.

Dr ANDREW HORNE showed a radiograph of triplets and described their successful delivery.

Vaginal Hysterectomy

Dr A H DAVIDSON, the Master of the Rotunda Hospital, read a paper on vaginal hysterectomy which was

illustrated by a coloured film. Dr Davidson said that he had adopted vaginal hysterectomy as the operation of choice in those cases in which the uterus was sufficiently small and was not bound by adhesions or extensive endometriosis. He had been impressed by the absence of post-operative complications and the smooth and rapid convalescence of his patients. He outlined the contraindications and the technique of operation under local spinal anaesthesia. He had performed this operation on ninety patients of whom one died from peritonitis. Forty-six patients in this series replied to a follow-up questionnaire. In forty-one the general health was good, it was indifferent in five, some vaginal discharge was complained of by three patients, four had symptoms of prolapse, and two of pain. Marital relations were satisfactory in all but three cases. In the discussion which followed Dr T M HEALY, Dr R E TOTTENHAM, Dr BETHEL SOLOMONS and Dr O DONNELL BROWNE took part.

ENGLAND AND WALES

Dickinson Scholarship Trust

A most interesting follow-up study has been published by the trustees of the Dickinson Scholarship Trust. It was in 1920 that a bequest of some £8,000 was received by the Royal Infirmary and the University of Manchester jointly to provide for an annual scholarship in anatomy, an annual travelling scholarship in medicine and in alternate years a scholarship in pathology and surgery. The trustees have reviewed the progress of those men and women to whom awards have been made since the first scholarships were given some fifteen years ago. It is remarkable how the Dickinson scholars have in their subsequent careers, risen to places of distinction in the clinical, academic and research departments of different universities. This review shows the great value of these grants and the care and discrimination that must have been exercised in awarding them, and gives point to the trustees' appeal for subscriptions, donations or legacies for the further endowment of clinical research. The scholarships are open to graduates of any university who have received the three final years of their medical training at Manchester. They are advertised normally in April in the *British Medical Journal* and the *Lancet* but the trustees are empowered to consider applications at any time for a scholarship or grant in aid of any research in any subject approved by them.

Treatment of Venereal Disease in London

The London County Council has given its approval to the continuance during the year 1937-8 of the arrangements for the diagnosis and treatment of venereal diseases in which six adjoining counties and three county boroughs also participate. During 1936 the number of new cases seen at the clinics was 26,077 but of these 12,817 proved to be non-venereal. Of the total number of new cases those of syphilis numbered 2,921, gonorrhoea 10,043 and soft chancre 296. It is pointed out however that these figures do not fully indicate the extent to which venereal diseases come under treatment in London as a not inconsiderable number of patients receive treatment from private medical practitioners. The number of new cases of ascertained venereal disease is lower by 2,000 than in 1935 when the figure again represented a reduction on the immediately preceding years. But the large decrease is largely accounted for by the fact that for 1936 the Minister of Health altered the form of return and omitted from that part showing allocation to areas certain cases which were formerly included—in other words patients who had formerly received treatment at some other venereal

diseases clinic are no longer regarded as new cases. Actually the figures on the old allocation would show a decrease of only 248 on 1935. Last year 37,748 examinations of bacteriological specimens were made at the request of and free of cost to medical practitioners, and the number of practitioners on the approved list for the supply of salvarsan or its substitutes was 556.

Grimsby and District Hospital

It has been decided to inaugurate at the Grimsby and District Hospital a special clinic for the treatment of patients suffering from fractures deformities and injuries of bones and joints, along the lines suggested in the British Medical Association's report on fractures. The hospital serves an area comprising the county borough of Grimsby, the borough of Cleethorpes and northern parts of Lindsey, Lincolnshire. The Grimsby Corporation has arranged to assist in providing an honorarium to be paid to the surgeon in charge and will pay the cost of maintenance of those patients for whom the local authority is financially responsible. Mr R. Guy Pulvertaft, F.R.C.S., has been given charge of the new clinic. Mr Pulvertaft has held appointments at St. Thomas's Hospital, the Norfolk and Norwich Hospital and the Robert Jones and Agnes Hunt Orthopaedic Hospital. At present he is surgical registrar to the orthopaedic and fracture department of Liverpool Royal Infirmary.

Deaths from Influenza in March

According to a return supplied by the Ministry of Health the number of deaths recorded as due to influenza in 122 great towns of England and Wales and the number included in the totals which were recorded in London for each of the four weeks to March 27, was as follows:

Week Ending	122 Great Towns	London
March 6	181	16
March 13	144	12
March 20	171	21
March 27	98	17

The total for the week ending March 27 was the lowest since December, 1936.

SCOTLAND

Jubilee of University Hall, Edinburgh

To celebrate the fiftieth anniversary of the opening of halls of residence for students at Edinburgh by the Town and Gown Association it is proposed to hold a dinner on Saturday May 29 in the North British Station Hotel, Edinburgh University Hall, which includes the houses of Ramsay Lodge, St. Giles House and Blackie House. This was the first attempt to institute corporate residential life in the Scottish universities and was largely the outcome of efforts on the part of the late Sir Patrick Geddes. Residence in these halls, although open to all students of Edinburgh University, has been almost entirely taken advantage of by medical students and has therefore in the past half century played an important part in the life of the Edinburgh medical school. Those old residents who desire to be present at the dinner should communicate with Sir David Wilkie, 9 Ainslie Place, Edinburgh 3.

Edinburgh Royal Infirmary Appeal

At a meeting in Edinburgh on March 23 Sir Thomas Whitson, chairman of the Board of Managers of the Edinburgh Royal Infirmary, said that an appeal for £500,000 had been made in 1920 and £300,000 had been raised but the balance of £200,000 was now required to meet the cost of the work. There was not a county in Scotland which did not send patients for treatment to this institu-

tion, and last year patients came from no fewer than ninety-two counties in England as well as from the furthest corners of the world. To-day the Infirmary had 1,100 beds and was treating 20,000 in-patients and 90,000 out-patients each year. It was very necessary to keep up to date with apparatus for both diagnosis and treatment, and Edinburgh was one of the half-dozen places in Great Britain which could give highly specialized treatment for cancer. In its radiological department 23,000 examinations had been made in 1936 and 8,915 therapeutic applications of x-rays had been made; it was estimated that in the present year the latter figure would rise to 15,000. With regard to the present appeal, it had been found fifteen years ago that the need for a new maternity hospital in Edinburgh was imperative, and the managers of the Royal Infirmary, recognizing the advantages of associating this with a general hospital, had agreed to take over the functions of the Simpson Memorial Hospital and to erect a new maternity building adjacent to the Infirmary. A new nurses' home had also become necessary, and these two buildings were now approaching completion. Professor R. W. Johnstone also spoke in support of the appeal, and mentioned that the work at the Maternity Hospital had more than quadrupled in the short period of twenty-five years. The new site of this hospital, facing south over the meadows, was one of the best in the city.

Physical Fitness in Scotland

At the inaugural meeting of the National Advisory Council for Physical Training and Recreation held in Edinburgh on March 20, Mr. Walter Elliot, Secretary of State for Scotland, said that special applications for grants would be considered by the Grants Committee, and the work being done by a similar council in England would be of the greatest importance to the subject of physical fitness in Scotland. It had been suggested that there should be five regional councils, but the scheme differed to some extent from the English scheme. Local organization would be based in Scotland on wider areas, and the scheme must in its early stages be experimental. Only experience would teach them what the ideal machinery was, and how they could best pool resources and work together until the scheme was in operation. Sir Iain Colquhoun, who presided, said that the members of this council had been chosen from men and women who were interested in physical recreation as a whole, and the services of specialists in various branches would be enlisted as the scheme developed. The first thing to do would be to provide the necessary facilities, leaders, and instructors for physical training and later to engage in propaganda to persuade the Scottish people to take part in the movement. There were many organizations, some large and others small and local in character, that were doing admirable work, but it was exceedingly difficult to assess the extent of the field which was already covered by such voluntary endeavours, although they were at least justified in saying that from a national point of view it was lamentably small. Scotland appeared to have lagged behind in the sphere of physical recreation.

Diet and Health

At a meeting of the Edinburgh Women Citizens Association held on March 20, Dr. Isabel Leitch of the Rowett Institute, Aberdeen, gave an address on diet in relation to health. She said that up to the early part of last century the food problem had been complicated by the seasonal nature of plant growth; man had been dependent on local produce and the standard of diet had been little more than that necessary for survival. The first standard of diet formulated in this country in 1863 had been for sufficient food to avert starvation diseases. Great advances had been made since then, and the standard to-day was for food required to maintain perfect health. It was a general fact that eaters of animal food had always excelled plant eaters in physical powers of endurance and enterprise, but the eaters of

mixed diets had in their turn excelled the meat eaters in all these respects. The populations of the Far East on a diet of rice and beans were all of relatively poor physique and subject to deficiency diseases. In Europe the pattern for diet and health varied greatly. The peasant populations of the Near East with a diet of cereals, beans, and olive oil were of poor physique, had high mortality rates, and pellagra was epidemic. In the industrialized countries there was a definite social gradient in the matter of diet, for the poor could buy only the cheapest foodstuffs which were not capable of supporting healthy growth without substantial supplements. Even in this country scurvy had tended to reappear nearly up to the end of last century whenever there was a potato famine, and gross rickets was common up to the beginning of the present century, while perfect teeth were still almost unknown. The present position might be summarized as follows: gross deficiency disease, except for rickets, had been eliminated, but the diet of the poorest people was still dangerously near the deficiency line. Dr Margaret Martin said that malnutrition in this country was largely due to economic factors: there was abundance of food, yet many people were unable to obtain sufficient to keep them in health. Dr G. L. Linklater, Medical Officer of Schools, Edinburgh, said that diet was not a panacea, although he did not underestimate its importance. He believed that the health supervision of children from 1 to 5 was still far from adequate, and he urged voluntary associations to undertake nursery schools in new housing areas. We should make sure, he said, that the pre-school child and the mother had adequate diets, and people required to be taught how to buy, prepare and serve food. Miss Grace Drysdale, Warden of the Edinburgh University Settlement, said that education in food and diet ought not to be confined to one sex, but in the last years of school life lectures on food values should be linked up with physical training. The particular taste of the Scots for solid and simple meals should be studied and popularized. Mr David Lubbock, of the Rowett Institute, Aberdeen, pointed out that to meet the needs of all the people with regard to optimum diets, milk, eggs, green vegetables, potatoes and fruit should be produced in greater quantities and the superabundance of cereals for which a market could not be found might well be checked. The problem of raising the purchasing power of those unable to afford an optimum diet should be tackled.

Edinburgh Post-Graduate Courses

The syllabus of the post graduate courses in medicine to be held in Edinburgh during the summer contains particulars of the instruction obtainable in July, August and September. From July 12 to 31 there will be a course in obstetrics and gynaecology at the Royal Maternity Hospital and the gynaecological wards of the Royal Infirmary, fee £8 8s. A general practitioners course will be held from August 16 to September 11, fee £10 10s for four weeks or £6 6s for two weeks. A general surgical course will be held concurrently. An eight weeks course on internal medicine will be held from October 18 to December 10, fee £15 15s. Graduates may obtain the syllabus from the secretary of post-graduate courses in medicine, University New Buildings, Edinburgh.

A. B. Fortes and A. Austregesilo (*O Hospital*, Rio de Janeiro, February, 1937, p. 127), who record two cases in a man aged 33 and a girl aged 19, state that the syndromes of cataplexy and narcolepsy usually appear simultaneously, thus showing the close connexion between the centres of muscular tonus and sleep. In exceptional cases such as that of the girl described by the writers, these syndromes may occur separately. The cause of the syndromes is almost always encephalitis lethargica as was exemplified in the present cases. In the second case cataplexy was associated with the Erb-Goldschlag symptom-complex of bulbar myelitis.

Correspondence

Food and Nutrition

SIR.—In reference to the report on the dietary survey by Professor E. P. Cathcart (*Journal*, February 27, p. 435), I would like to record agreement with one opinion expressed—namely, that the main causal factor of inadequate diets in many households is ignorance of how to buy, what to buy, and how to use the material bought. I have also discovered that there is ignorance of how to persuade the child to eat what is put on the plate. Father may bring home sufficient money, mother may have sufficient knowledge of how and what to buy and how to use, and yet both may fail in the last stage of dieting—that is, to get the food from the plate into the child's stomach.

I have records of children who refuse to eat butter but prefer margarine or even dry bread, of children who chew meat and spit it out again, of other children and adults who habitually leave fat and green vegetables. Some time ago a girl 15 years of age suffering from tuberculosis of the lungs came under my care. Her father said, "I have bought the best food money can buy, yet she won't eat meat, fat and green vegetables; she only likes potatoes and gravy and puddings." A youth of 16, suffering from pleurisy with effusion, stated that green vegetables were served three or four times a week, yet he had never eaten them nor had he eaten fat. In conversation with his mother the value of these foods was emphasized, and she remarked, "My fault is that I have given afters (puddings) when they have left the first course." Parents need education in the understanding and guidance of the child.

Inadequate dieting has a psychological aspect. Many members of the medical profession do not yet seem to have realized the importance of the protective foods. I have records of children who have had out-patient treatment at general and children's hospitals, and yet mothers report that no question was asked about the habitual diet of the child and no advice given as to diet, and yet these children have been in the habit of leaving fat and green vegetables. In Hippocrates is written: "A physician must know what man is in relation to foods and drinks and to habits generally." Is not this just as important for us in A.D. 1937 as it was for Hippocrates in 400 B.C.?—I am, etc.,

P. A. GALPIN,
Tuberculosis Officer.

West Ham, March 24.

A New Treatment for Chronic Leucorrhoea

SIR.—Before adopting the treatment by zinc chloride advocated by Drs. Alcock, Bourne, L. T. Bond and K. A. McGarrity under the above heading in the *Journal* of January 16 (p. 116), I earnestly hope surgeons will give the proposal careful consideration. Forty years ago German surgeons (Duhrsen and others) advocated the same treatment using a 1 in 4 solution—that is, much weaker than that recommended in the above paper—applied for only a few minutes once weekly on a very limited number of occasions. Yet even in this form it brought about more serious troubles than the one it was designed to cure.

By destroying the intra-cervical tissues this treatment leads to contraction, stenosis and interference with normal drainage, followed by the infection which in

variably follows on blocked drainage from any of the bodily reservoirs. The authors do not refer to these evil results, probably because sufficient time has not elapsed for them to become evident but I can assure readers that I have seen them on a number of occasions and have also noted the sterility which followed, if it did not originate in, the procedure. Similar untoward results have followed the modern treatment by diathermy and electric cautery. Simple erosions of the os uteri in nulliparous women due to proliferation of the intracervical glandular epithelium over the squamous epithelium of the portio can be cured by one or two applications of zinc chloride 1 in 4 solution at fortnightly intervals, but the application should not be passed into the cervix for the reasons stated above. Endocervicitis of not too long standing can be cured by applications every five days of a solution of

R Argent nit gr 1/16
Aqua dest " qs
Spirit aetheris nitrosi ad 3j
Fiat applic

Sig Shake the bottle

A little pledget of sterile wool soaked in this solution and held in a long sinus forceps is thoroughly rubbed into the whole length of the cervical canal. If vaginitis is present a larger quantity is applied to the vaginal surfaces held apart by the vaginal speculum. As the solution comes in contact with the sensitive vulva more or less smarting is produced relieved instantly by the use of a fan which should be in readiness. This solution is very effective for pruritus vulvae and an and dry eczema. I introduced it for the treatment of these conditions some thirty five years ago and its value was testified to by several speakers at a meeting of the Gynaecological Section of the British Medical Association last month. When endocervicitis is chronic or associated with injuries to or degenerative changes in the cervix the treatment should be surgical either the Sturmdorff operation or the ordinary resection according to the conditions present gives excellent results—I am, etc

Open-air Treatment for Pneumonia

SIR—I have read with great interest Dr H L Wallace's article on continuous open air for pneumonia in children (*Journal* March 27 p 657). We have used the method he advocates—placing the child by a widely open window and allowing the cold air to play directly on its face—at Alder Hey for some years. On looking at our results I find that they approximate to the results obtained by Dr Wallace and give herewith a table showing the results obtained in the treatment of 1880 cases of pneumonia by this method.

Age Period	Cases	Deaths	Per Cent
Under 12 months	85	40	4.11
12-23 months	451	87	19.73
2-3 years	27	27	10.43
3-5 years	306	12	3.95
5-8 years	367	13	3.61
8-10 years	353	23	6.34
Total	1880	202	10.7

These figures are crude the mortality rate not having been corrected in any way for deaths occurring shortly after admission. Unfortunately I have no controlled series as we use the open air method of treatment for all cases. I can fully endorse the view expressed by Dr Wallace on clinical impressions of the treatment. In this hospital it is the exception for oxygen to be administered to cases of pneumonia, and there is hardly ever any difficulty in persuading the patients to take sufficient nourishment. One is also impressed by the fact that children treated by this method sleep so much during the acute stage.

It is interesting to note that we have treated some cases of pneumonia on an open air balcony and find that they do remarkably well. The objection mentioned by Dr Wallace—namely the lowering of the ward temperature for other children—is a real one. Perhaps when we realize to the full the value of fresh air in the treatment of children and the value of segregation of patients in cubicles this objection will be met by having children's wards divided up into cubicles of various sizes with facilities for open air treatment in each cubicle.

I think we owe a debt of gratitude to Dr Wallace for bringing to our notice a method so effective and yet so simple in the treatment of this serious infection of childhood—I am, etc,

Blood-sugar Worship

SIR,—May I congratulate Dr Oliver Walker upon his definite reply he gives to Dr Guy Bolsfield's question.

Are they to be allowed to run high blood sugars throughout the day as long as they remain free from ketosis and glycosuria when he writes. The answer is Yes for how few diabetics are consistently sugar free. No doubt his reply is based upon a ripe experience of diabetic patients treated in that manner over a period of many years, and he is satisfied that the treatment protects against the many complications of that disease. If this be so his experience is very different from mine, which extends over more than thirty years.

He asks: How few diabetics are consistently sugar free? I cannot reply to that question but if he had asked: How many diabetic patients are consistently free from glycosuria? my reply would have been: Of those with normal renal thresholds for dextrose well over 90 per cent of the cases under my care.

In the early days of insulin many physicians were satisfied when their diabetic patients presented neither glycosuria nor ketosis but at the present day surely our aspirations are higher and we aim at the development of remissions at a metabolism approaching as nearly as possible to that of the average normal hoping thus to protect our patients from neuritis arteriosclerosis and the many complications of diabetes mellitus. Since the renal threshold for dextrose in a diabetic may rise to 0.22 per cent it is obvious that the examination of the urine will not ensure the sugar content of the blood being kept within normal limits and will not protect against complications.

I have seen remissions develop in more than thirty cases—that is to say improvement which has continued until insulin has no longer been necessary and in some cases ordinary food has been taken—and these remissions have lasted from six months to ten years. I have attributed these improvements (perhaps incorrectly) to regeneration of the pancreas following a long period of

comparative rest, accomplished by keeping the sugar content of the blood below 0.15 per cent and by the patient's abstaining from alcohol. The treatment should be designed for the individual.

The physician should decide which is the lesser evil: the frequent examination of the urine by the patient, with the attendant alarm when sugar is found, or the examination of the blood four times a day at intervals of a few months, combined with the order that should any symptoms of any kind develop, however trivial, medical advice should be sought without delay—I am, etc.,

London W 1, March 25

O. LEYTON

SIR—I was pleased with Dr Oliver Walker's letter in the *Journal* of March 27 (p. 684) because, like some others, I have long felt that occasional blood sugar estimations do not help in the treatment of those attending a diabetic clinic; in fact, they have proved a confusion to me and have not led me in the direction of better treatment.

In the very large majority of cases I am now content with the ordinary test-tube examinations of the urine for with such help alone I am able to avoid severe ketosis and to help those attending towards that sense of returning well being which, as Dr Himsworth has emphasized is the real object of treatment. I find this improvement follows when an acceptable diet is prescribed arranged qualitatively and fixed quantitatively, even though the urine contains a fair amount of sugar from time to time during the twenty-four hours. The test-tube warns me of the approach of danger but I do not allow it to dictate an unnecessary or even harmful diet—I am, etc.,

Portsmouth April 1

H. FARNCOMBE

SIR—In reply to Dr Oliver Walker (*Journal* March 27 p. 684) I must point out that I do not form opinions on the condition of diabetic patients on the evidence of single blood sugar estimations nor did I say so. I am prepared to do as many blood sugar estimations as he would make urine examinations if necessary. I always use urine examinations myself in following up the crude stages of my treatment. The only difference is that at the end of my work I have a true idea of the behaviour of the patient's blood sugar throughout the day, whereas the urine method unaided tells only of the difference between glycosuria and hypoglycaemia. In the case of a raised renal threshold therefore urine estimations alone tell one say that the patient's blood sugar is not lower than probably 0.100 per cent and not higher than shall we say 0.280 per cent. I am afraid this will not satisfy me.

People who have a raised renal threshold will of course develop hypoglycaemia if their blood sugar is suddenly brought to normal but not if the sugar level be trained down. Such patients can ultimately run normal blood sugars without fear of hypoglycaemia—I am, etc.

London S.E. 5 March 26

GUY BOLSFIELD

Transfusion Fatalities

SIR—I read with interest Dr N. S. Plummer's article in the *Journal* of December 12, 1936 (p. 1186) on blood transfusion. I have been practising blood transfusion in India for some time and I appreciate the candour with which Dr Plummer has reported his fatalities as a result of transfusion. His article encourages me to add my single case to his group of six.

A woman 30 years old suffered from severe pregnancy anaemia during her second pregnancy. She delivered normally and responded to liver therapy to some extent. During her next pregnancy about a year and a half later there was a relapse of anaemia. She gave birth to a stillborn baby and the anaemia showed no signs of improvement even under liver treatment. Blood transfusion was proposed and after cross-matching 100 ccm of blood were given by Braun's apparatus. More blood was not given because the patient had slight dilatation of the heart. The patient appeared to bear the transfusion well and seemed to be happy after it. About five hours after the transfusion she was reported to have suddenly collapsed and died. Post mortem examination was not available.

I attribute the fatality to a degenerated myocardium as a result of long-standing anaemia which could not cope with the transfused quantity of blood.

With reference to his case No. 5 Dr Plummer cautions against the danger of using the same donor for a second transfusion, and refers to serious reactions recorded by other authors. I beg to differ from him on this point. In three of my cases I have used the same donor for three or more successive transfusions without any bad effect on the recipient. The amount given each time was above 150 ccm. Dr Plummer explains the death in his case No. 5 by assuming that as a result of the first transfusion the recipient has become sensitized to his donor's blood. Probably he is right. In my cases of mono-donor-transfusion the sensitization was perhaps obviated by the fact that the transfusions were performed every fourth or fifth day. As the subsequent transfusions were done within a week of the first one they helped to desensitize the recipient and no untoward results followed. In conclusion I believe that the danger of using the same donor for a second transfusion is unnecessarily exaggerated provided the transfusion is repeated within a week—I am, etc.

Poona City India March 18

P. L. DESHMUKH M.D.

SIR—May I take the opportunity of replying to the correspondence which has arisen out of my article in the *Journal* of March 6 (p. 496). While I agree with Dr Loewy (March 20, p. 641) that morphine is of great value in quieting the anxieties of any patient before an operation I do not think that atropine given before a transfusion would prevent the occurrence of pulmonary oedema four hours later—as happened in my second case.

Dr Howie Wood's criticism (March 20, p. 641) of my omission to refer to the drip transfusion as an alternative mode of treatment is to some extent justified. I have one suggestion to make which extenuates it to some extent. Does not the passage he quotes from Marriott and Kekwick's article imply that the method is not quite without risk in patients in a weak condition or in subjects of cardiovascular disease? To raise the haemoglobin of a patient from 20 to 50 per cent in an adult involves transfusing about three pints of blood. This is a very considerable amount of fluid to add even slowly to a damaged cardiovascular system.

In answer to Dr Shera (March 27, p. 686) may I say that the patients' blood was grouped against stock sera and a donor of the same group obtained from a blood transfusion service. The donor's group was confirmed by testing his blood against the stock sera and finally both donor's and patient's blood were mixed directly. I think the possibility of cross-agglutination being responsible for the fatalities may be ruled out. By anaphylaxis in connexion with blood transfusion I mean reaction not due to the agglutinating cells of the blood but due to the action of some poison in the plasma of the

donor to which the patient has been sensitized—such as might follow a previous transfusion from the same donor. The time taken over the transfusion of one pint of blood by the indirect (citrate) method was about forty five minutes. It is impossible under ordinary circumstances to take more than one third to one half this time using the direct Joubert method on account of clotting oftenest on the patient's side of the syringe.

Lastly may I thank Drs Loewy, Howie Wood and Shera for their kind appreciation and most stimulating criticism—I am etc.,

Birmingham March 27 FRANK PYGOTT M.B., D.P.H.

Accidents and Diabetes Mellitus

SIR—In view of the interesting problems associated with the above may I recount a case at present under my observation.

A middle aged man came to me with a painful forefinger. He stated that a few days previously he had bruised it. The finger was slightly swollen with some infection under the matrix of the nail. Within a day or two the pulp of the finger became infected. Appropriate incisions were made but it did not improve. I referred him to the Birmingham General Hospital and the surgical staff very kindly treated him.

A week or so later he saw me and I learned with some surprise that the finger had been amputated. The stump was unhealthy. I remembered that some years ago he had had a gastro-enterostomy done for gastric ulcer and that he had then had a slight degree of hyperglycaemia. This cleared up with a short course of insulin and he remained quite well, being free from the condition when I had examined him on several occasions subsequently. I informed the hospital of this fact in the man's previous history. A slight hyperglycaemia was again found to be present and small doses of insulin have brought about a wonderful alteration in the finger showing I think that the chemical changes in the tissues consequent upon injury in individuals with a high sugar threshold are profoundly different from those in the normal person.

Whether it is the toxins or bacteria from the damaged tissues acting upon the blood direct or on the higher centres one cannot say but such is the factor in this case—first a surgical operation secondly a small bruising of a finger causing a vicious circle delay in normal healing and necrosis of the finger bone which clears up when the balance is restored by small doses of insulin. The other interesting point—for the employer—is that such an injury is the result of an accident and comes under the Workmen's Compensation Act. One can readily visualize the difference such an accident will make to a hyperglycaemic man or woman in the time such a disability takes to resolve and from a legal point of view the difficulty that may be caused in the way of compensation—I am etc.

Birmingham March 28

CLEMENT BELCHER

Angina Innocens

SIR—The paper on angina innocens by Dr Geoffrey Bourne (*Journal* April 3 p. 695) is one which will be of interest to students of cardiac affections and also to medical practitioners. May I be allowed to refer to a case which I saw lately (and the only one I have ever seen) which seems certainly to be an instance of this malady.

It is that of a middle aged woman who was under my care long ago for asthma. She got over the asthma and was for years quite clear then it recurred and after treatment it again disappeared. In September of last year she was well for most of the summer she had been very ill. She

said "I am in bed and sometimes but especially at night, I have a stab like that of a knife going through my chest shoulder and left arm. It is very painful and lasts for hours. She asked me to come and see her as a friend and in doing so I found she had a doctor attending her and that he came three times a day and occasionally during the night if sent for. I found her heart and lungs perfectly normal to percussion and auscultation. Her blood pressure also seemed quite normal. Palpitation came on severely during the attack and sometimes she vomited. There was practically no nervousness nor had she any asthma. Her married daughter who attended her said it was supposed to be angina. I told them I found no sign of it. I wrote her doctor but gave no expression of opinion. In his reply he said he suspected the liver or gall bladder and thought she ought to have an x-ray examination.

The case fulfils Dr Bourne's criteria of there being no pain after exercise no evidence of cardiovascular disease palpitation common with attacks sometimes in bed. The same attacks continued for about four months, then they became less and finally practically disappeared. She called for me lately and was in good health but occasionally she has some pain. It will be interesting to see how she continues—I am etc.,

London W1 April 3

A. G. AULD

Effects of Radium Treatment

SIR—In the article which appeared in the *Journal* of March 27 (p. 651) under the heading 'Effect on the Eye of Radium Used for Treatment of Malignant Disease in the Neighbourhood' stress is laid upon the damage done to the eye.

The cases mentioned in the article were all of extreme malignancy and the question arises whether by surgery alone or by surgery combined with any method other than radium treatment damage to the eye could have been avoided. There is unfortunately at the present time a growing tendency in the public mind to regard all radium treatment with dread. When death follows malignant disease this is looked upon as the sad but natural termination of the disease. If however death occurs after radium treatment it is the treatment that is remembered to the extent that it is almost the radium treatment that comes to be looked on in the lay mind as the cause of death. On the other hand, the fact that many a cure in cases which have been diagnosed as malignant has been effected by radium treatment is accepted quietly hardly attracts attention and is indeed soon forgotten. Such is human nature.

It is now some thirty five years since radium came into use as a remedy in the treatment of disease. There is no doubt but that in its early employment too great hopes were raised and have been followed by a corresponding feeling of disappointment. The same may perhaps be said of the hopes raised by the employment of continually larger and longer doses by the insertion of needles and of radon seeds the endeavour being to make radium a sufficiently powerful destructive agent.

In all new treatments there is a tendency to run to the extreme and as larger supplies of radium became available so the tendency to use excessive doses—partly to hasten results and partly as a means of reaching deep-seated tissues—would appear to have become the chief objective. But one of the undoubted effects of radium is continually seen in its power to convert abnormal tissue back to the normal. The normal tissues would appear to be stimulated by the rays to counteract and overcome and gradually to restore to the normal those tissues in the cells of which nerve control has been lost.

or modified. To obtain this result excessive doses are not required but are contraindicated.

Can we improve upon the *vis medicatrix naturae*? I would enter a plea for the application of radium not as a destructive agent but in more moderate doses employed in such a way as to assist the natural forces which the human body is capable of exerting giving time and patience and depending less upon large doses as a destructive agent with the object of obtaining speedy and spectacular results.

At the present time there seems to be a general impression in the public mind that radium treatment is painful. This is not the case. When applied in the manner suggested radium treatment is painless and in the article referred to occurs the statement, "pain is not a feature, even of a severe conjunctival reaction or even of corneal necrosis." Pain in radium treatment occurs when it is used in excessive doses and as a destructive agent also in conditions which may be brought about by its use in that manner. I would quote the case of a lady who had an innocent tumour in front of the shoulder. Into this half a dozen radium needles were inserted and left for six days. The result was interference with the circulation in the axilla.

In conclusion being myself a firm believer in the efficacy of radium as a remedial agent my letter is written with the object of attracting attention to the good work which is being done in many directions and to the good results which are being obtained so that the apprehension of the public, which is undoubtedly largely existent at the present time with regard to radium treatment, may be allayed—I am, etc.,

RALPH H. BROWNE-CARTHEW, M.D.

London, S.W., April 5

Acquired Haemophilia

SIR—Mr C. V. Braimbridge's case of acquired haemophilia described in the *Journal* of February 6 (p. 301) is indeed very interesting. Though acquired haemophilia is not known to occur it is very difficult to explain the case in any other way particularly in view of the fact that the patient was operated on in 1927 without any untoward effect.

With regard to the treatment I would suggest the use of styphen which is a preparation of Russell's viper venom put on the market by Messrs Burroughs Wellcome and Co. It can be used either by local application in a dilution of 1 in 10,000 or by intradermal injection in a dilution of 1 in 100,000 the dose for injection being 1/2 to 1 ccm. Dr Hance of Bangalore has even used the preparation for intravenous injection without any ill effect. For further information I would refer readers to a paper on the subject by Dr J. B. Hance in the *Indian Medical Gazette* of February, 1937 in which he describes three cases of severe post-operative bleeding in haemophiliacs treated by styphen used in three different ways—namely local application, intradermal injection and intravenous injection. In one of the cases bleeding occurred after tonsillectomy—I am, etc.,

Norwich, March 5

K. A. ADAMS

The Birching of Children

SIR—The letter in the *Journal* of March 27 by Dr Maple is somewhat amazing. He would have us believe that the ceremony of birching young offenders approaches that of the grim ritual portrayed in the film *Mitins en la Berta*.

I have myself witnessed about a dozen birchings of young children and although it is not a pleasing spectacle I have no hesitation in saying that in not a single instance was there any sign of that physical and mental anguish that Dr Maple would have us believe afflicts the unfortunate victim. In every case the victim left the prison as if nothing had happened. In every case the birching was administered with the consent of the boys and there is an alternative to imprisonment.

Every boy who is worth his mettle, no matter to what class he may belong, knows that when he does a mischievous thing he may, if he is unlucky enough, be found out, be called upon to pay the penalty. A mischievous spirit is part of every healthy boy's character and if punishment is given painful though it may be he accepts it as part of the game—that is the essence of sportsmanship. If, as Dr Maple says, a birching damages a boy's mental make up for six weeks then I fear that all the English public schools must be full of potential nervous wrecks. Nothing is further from the truth.

The growth of psycho-analysis in the last few years has been amazing but it is a double edged weapon and should only be applied to certain chosen cases. Applied haphazard it can do the most incalculable harm and turn healthy young people into hypochondriacs and incurable neurotics. The increase of juvenile crime during the last ten years has been a difficult problem to tackle but I am of the firm opinion that corporal punishment carried out humanely and with every consideration for the particular case in point is a far better method of controlling crime than a lot of indiscriminate dabbling with a science about which so few of us know so very little—I am, etc.

P. G. BENTLEY, M.D., M.R.C.P.

Medical Officer H.M. Prison, Jersey

Jersey, March 31

Milk and the Health of the Cow

SIR—After reading Dr Brockington's article on compulsory pasteurization of milk (*Journal*, March 27, p. 667) I feel that if all the intellectual energy of the M.O.H.s expended on behalf of milk pasteurization had been directed into channels for the prevention of disease in cows the whole problem ere now would be well on the way to a satisfactory settlement. He like all his colleagues has been vigorously advertising the value of milk drinking and thereby encouraging an increased production of milk at the expense of the poor old cow.

All the milk-registering societies are of the devil because their great aim is to record a pathological disturbance of the cow's udder resulting in an increased flow of milk which is only fit to drink when still further damaged by pasteurization. These pathological udders indicate a lowered vitality of the cow and a predisposition to further disease whereby the tubercle bacillus *Brucella abortus* and streptococcal organisms are able to flourish all the more abundantly.

It is bad enough for a strong healthy cow to struggle against adverse conditions when fed on food grown on an impoverished soil but when cows with pathological udders have to struggle against the market on limited soil Dr Brockington is silent. We can hope to have a healthy nation only when we realize that man and land and soil are inseparably interdependent and that they rise and fall together. If we do not realize this we are in a race which these days is ravenous—we can expect to have to get good food and if the cow does not do all the become predisposed to so many diseases that he may and he must suffer. No more of pasteurization and gone to hell the cow to recover in a few years.

reduce even good milk from a first class food to one of mere subsidiary value necessitating a variety of specially prepared adjuncts wherewith to try and deceive Nature

It is as long ago as April and July, 1906, that I was allowed in the *British Medical Journal* to point out the great value of the lime salts for human beings. Fortunately a few of my colleagues had hearing ears and my only regret is that I did not then point out their importance for animal health as well—I am, etc

Swansea March 27

G ARBOUR STEPHENS

Compulsory Pasteurization of Milk

SIR—While naturally agreeing with Dr C Fraser Brockington that compulsory pasteurization is imperative may I be permitted to ask about cream butter and cheese. I understand that these products of milk simply teem with microbes of all kinds and I presume that eating them is just as harmful as drinking. Does Dr Brockington propose that no butter or cheese should be made except out of pasteurized milk and if so can he tell us whether this is practicable?—I am etc

Stoke-on-Trent April 3 PAUL BERNARD ROTH, F.R.C.S.

Combined Universities Election

SIR—I am constrained to endorse the sentiments so well expressed by Dr Manson in your issue of April 3 relating to the appalling apathy of medical graduates who omitted to take advantage of such an excellent opportunity of returning Sir Henry Brackenbury in the recent contest. As one of the representatives present at the Annual Representative Meeting in Oxford last July I well remember heartily concurring with the expressed need for adequate representation in Parliament and the desirability of securing someone who would be able to speak with authority on medico-political matters. There is surely no more able, efficient and well-equipped candidate in the profession for this purpose than Sir Henry and when one realizes the prodigious energy, devotion and enthusiasm with which he has served the profession for so many years the epithet of Dr Manson applied to his colleagues shallow-pated amnesia is more than justified.

It is much to be deplored that blind loyalty to party politics should have resulted in the loss to the House of Commons of such a distinguished leader of the profession particularly at this critical juncture when the legislature is in such need of strengthening with men of experience and practical knowledge of our public health services and administration. What is the use of grousing and then failing to seize opportunities of redress?—I am etc

Bournemouth March 4

WALTER ASTEN

Why "Nocifensor"?

SIR—I hope I shall be forgiven for butting into an argument which is really none of my business nor would I presume to take the word for Sir Thomas Lewis who is obviously quite capable of defending his nocifensor system of nerves with his superior Latin erudition. But I fear that all of us who have learnt the Latin of the ancient Romans must blush for them since they ignored the rules which Dr F J Allen's classical scholars have established for their language. The fact remains that *nocce* turns into *noctis*, *prohibeo* into *prohibitio*, *medior* belonging to the same group into *mediculis* and *medicatio* and even the monument of Dr Allen begins to shake when we find in brackets in some of the larger handbooks the spelling of *monumentum* cut off *monu*. The examples can be multiplied by anybody who cares to turn the pages of a Latin

dictionary. I trust a man of Dr Allen's learning will not take amiss this little attempt to rescue the pleasanter word for our tongues—I am, etc,

London W1 March 31

LUCIFER.

Radiograph or Skiagram

SIR,—I am disappointed to learn of the objections which can be stated against the word *skiagram* as detailed by Dr R Boulton Myles (*Journal* April 3 p 731) and I am indeed sorry that he finds it has no case. Of course this is simply a matter of opinion but what appeals to me about the word *skiagram* is that it suggests—remotely at least—the real nature of an x-ray photograph—namely, that it is a *shadow picture*. And to this extent and for this reason it seems to me to have more meaning and to be a more expressive word than its rival *radiograph* which faced the starter in its company in those murky days of 1896.

If this argument appears to Mr Boulton Myles to be merely trifling or whimsical there is nothing more that I can add but must leave the matter to the judgement of subtler minds and tastes than my own—I am etc

Broadstairs April 5

R S LAWSON

The Services

AUXILIARY R.A.M.C. FUNDS

The annual meeting of the members of the Auxiliary R.A.M.C. Funds will be held at 5.15 p.m. on Friday April 23 at 11 Chandos Street Cavendish Square W., when the annual report and financial statement for the year ended December 31 1936 will be presented and the officers and committee for the current year elected.

DEATHS IN THE SERVICES

Lieut Colonel ROBERT GALE, D.S.O. R.A.M.C. (ret.) died at Southsea on March 14 aged 49. He was born on August 16 1887 and was educated at Glasgow University where he graduated M.B. Ch.B. in 1909. Entering the R.A.M.C. as lieutenant on July 31 1909 he got a brevet majority on June 3 1919 became lieutenant-colonel on May 1 1934 and was placed on temporary half pay on account of ill health on March 20 1936 retiring very shortly afterwards. In 1913-14 he was on special duty in Egypt which he left to enter the war of 1914-18 when he was mentioned in dispatches in the *London Gazette* of June 29 1915 and January 1 1916 and received the D.S.O.

Colonel FERBERD RICHARD BUSWELL, C.M.G. late R.A.M.C. (ret.) died in Kensington on March 13 aged 72. He was born at Brixton on November 3 1864 was educated at the Midsex Hospital and took the M.R.C.S. and L.R.C.P. London in 1887. After filling the posts of house surgeon and hospital physician at his hospital he entered the Army as surgeon lieutenant on January 30 1893 became colonel on December 20 1917 and retired on March 20 1920. He served in the China War in 1900 gaining the medal and in the war of 1914-18 when he was mentioned in dispatches three times in the *London Gazette* of June 23 1916 January 4 1917 and December 24 1917—and received the C.M.G. in 1917.

Colonel PHILIP JAMES LUMSDEN, Bengal Medical Service (ret.) died at Fleet Hant on February 27 aged 73. He was born on February 2 1864 at Gorakhpur where his father was then magistrate and was educated at Aberdeen where he graduated M.B., Ch.B. in 1886. Entering the I.M.S. as surgeon on September 29 1888 he attained the rank of colonel on October 15 1918 and retired on November 27 1920. Most of his service was spent in the political department where he was agency surgeon for the States of Kohat and Jalhwar and subsequently agency surgeon and administrative medical officer in Baluchistan. He served on the North West Frontier of India in the Miranzai first expedition of 1891 and also during the war of 1914-18 when he was mentioned in dispatches in the *London Gazette* of June 26 1916. His younger brother, J. S. S. Lumsden entered the Bengal Service in 1891 and died in 1906.

Obituary

C C CHOYCE, M.D., F.R.C.S.

*Late Professor of Surgery and Director of the Surgical Unit
University College Hospital*

We regret to announce the death on April 2 after a long illness of Professor C C Choyce, who had lately retired from the post of director of the surgical professorial unit at University College Hospital London.

Charles Coley Choyce was born in Auckland in 1875 and graduated B.Sc. of the University of New Zealand at the age of 21. He then came to this country and studied medicine at the University of Edinburgh graduating M.B. Ch.B. in 1901 and proceeding M.D. three years later after holding house appointments at the Leicester Infirmary. In 1904 he became clinical assistant in the surgical department of the London Hospital and after taking the F.R.C.S. Eng. diploma, was appointed to the surgical staff of the Albert Dock Hospital and medical superintendent of the Dreadnought Hospital, at which institution he later served as assistant surgeon and surgeon to in-patients. He was also for four years surgeon to out-patients at the Great Northern Central Hospital and teacher of operative and clinical surgery at the London School of Clinical Medicine, Greenwich.

On the outbreak of war in 1914 he applied for a temporary commission in the R.A.M.C. and for nearly two years was officer in charge of the surgical division of the 19th General Hospital. In 1917-18 he was consulting surgeon to the Egyptian Expeditionary Force with the rank of Colonel A.M.S. He received the C.M.G. and C.B.E. for his war services and soon after the Armistice was appointed director of the newly formed surgical unit at University College Hospital and professor of surgery in the University of London. Among other posts held by Professor Choyce in recent years were those of consulting surgeon to the convalescent home for officers at Osborn and examiner in surgery to the Universities of London, Durham and Bristol. When he retired from active work, on account of ill health, he was elected consulting surgeon to University College Hospital.

His chief literary work was the editing of Choyce's *System of Surgery* (now in its third edition) for which he wrote several articles; he also contributed to Carson's *Modern Operative Surgery* and to the *Dictionary of Medicine* and edited the seventh and eighth editions of Treves's *Surgical Anatomy*. His wife Gwendolen, daughter of J. C. Dobbin J.P. of Chislehurst, Kent, survives him with a son and a daughter.

Mr Julian Taylor writes:

The death of Professor C C Choyce on April 2 was unfortunately no surprise to his colleagues and other friends who had watched with concern the progress of his long illness so bravely borne that none of them ever heard a complaint. Already a graduate of the University of New Zealand he first came to Europe in 1896 to study medicine in Edinburgh where in 1901 he graduated at the age of 26. Almost at once he came South and after holding various junior appointments he was elected surgeon to the Seamen's and the Great Northern Hospitals in London. He quickly settled down into successful consulting practice with a facility that derived from his already mature and balanced judgement as well as from a kind heart and he was soon well known to a large circle of friends in general and consulting practice. His teaching at the Dreadnought Hospital became a London institution

and he quickly gained a large post graduate clientele among those preparing for the higher examinations as well as those just wishing to learn surgery. Large numbers of whom to-day remember with gratitude his well organized operative surgery class far more comprehensive in its scope than its title suggests. Contact with post graduates showed him the then existing need for a large modern textbook of surgery more fully informative than the students' books of the day and this need he set himself to meet. Collecting a large number of eminent contributors including himself he undertook the formidable task of editor and in 1911 Choyce's *System of Surgery* in three volumes was published by Messrs Cassell which as medical director he later became. Success was immediate and was due at once to his efficient editorship and to the wide cast of his net in catching his writers not all of whom could completely forget even in the presence of his disarming good nature compression and correction of their contributions. Choyce's early education had given him the command of our language; he had an ear for a good sentence and a hawk's eye for indifferent syntax.

The war took him to Egypt where he soon became consulting surgeon to the Mediterranean Expeditionary Force where he earned well his C.M.G. and C.B.E. But it took from him a large London practice which, though the task would have been he was not anxious to bring together again in 1919 having become greatly interested in the projects of some of the London medical schools to found professorial units staffed by officers giving their whole time to hospital and school. At University College Hospital where he was made director of the surgical unit Choyce began work early in 1920 and seemed at home from the first. He not only directed his unit but so completely identified himself with his new hospital that no stranger would have guessed his recent coming. To his students he was P.P. Choyce; to his colleagues he was a central figure to whose administrative help they could always turn and to his patients he was what he had always been kind, gentle and level-headed. To each he had the right approach that is born of sympathy and in his daily round he never deprived himself of his greatest pleasure—his visits to the children's ward. He had lost a son from osteomyelitis. A sportsman to the end he had played Rugby football and cricket for which he cherished an affection that would sometimes lead him to Lord's on a summer afternoon. The enlargement of the hospital following on the Rockefeller benefactions gave him an opportunity to exercise another of his gifts and he would pore over plans at all hours; it is largely due to his care and forethought that so excellent a use of the available space was made cramped as the site proved to be in the expanding needs of modern medicine. Necessarily a member of a large number of committees he rarely missed a meeting and he was never impatient of their sometimes boring routine. As director of the unit he took on the responsibility for the organization of the whole of the surgical teaching of the hospital his colleagues as well as his own. His ward visits were crowded yet the latest joined students were always his especial care and as with many other famous teachers if his stories had sometimes been heard before they were received with an appreciation that showed that the meaning had gone home. His surgical lectures were wide and intense and ranged from the blunty passages to the delicate tongue and the delicate. He clinically demonstrated thus of an insight by his medical colleagues and students never of a more technical and less practical in current demand.

In 1926 the first sign of his ill-health appeared, and during the next ten years his physical forces gradually deteriorated until almost the whole of the operative work of his unit was done by his assistants, to whom the loyalty of their chief was a secure possession. Throughout this time, however, until his enforced and deplored retirement his whole mind and personal capacity were at the disposal of the hospital and school its organization and its students, but it is not only in University College and his earlier hospitals that his loss from the company of surgeons is felt.

JOHN ARNOLD JONES OBE

MB ChB., F.R.C.S.Ed

The death occurred suddenly on March 23 of Dr Arnold Jones of Manchester at the age of 57. Arnold Jones, known to many of his colleagues as 'Jimmy Jones,' was a Manchester student taking the MB ChB Vict in 1903 and the F.R.C.S.Ed in 1905. During his student days Jones was a keen follower of university politics, and cultivated the habit of public speaking, which he retained throughout his career and he could always be relied upon to make a clever, interesting, and witty speech. After being house surgeon at the Manchester Royal Infirmary he showed leanings towards specialization in ear, nose and throat work and was in turn house surgeon to the Royal Ear Hospital London, and to the Birmingham and Midland Ear and Throat Hospital. His further education he completed in Vienna. During the war he early joined the R.A.M.C. and saw service with the 29th General Hospital in Salonika where he was made consulting aural surgeon and laryngologist to the British Expeditionary Force. For his services he was awarded the OBE, and returned with the rank of major. At the time of his death he held various appointments including those of consulting aurist to St Mary's Hospitals, aurist and laryngologist to the Royal Manchester Children's Hospital and honorary surgeon to St John's Hospital.

Jones was a well known figure in aural surgery and his contributions to the subject whether written or delivered before some society, always brought to light a new angle of approach and stimulated discussion. He brought his volatile temperament into all he did, and whether in social or in professional circles he was usually the centre of an animated conversation. His professional work was characterized by great care and thoroughness in all he undertook and he achieved a reputation of which any surgeon could be proud. His chief recreations were reading and golf; the latter however, had been denied him for some time owing to poor health and one can only regret that rather against medical advice he returned to work earlier than he should.

One of Jones's chief characteristics was his capacity for friendship. A good raconteur, bubbling over with vivacity, he was the life and soul of a party in his younger days, while in his later years nothing pleased him so much as a quiet reunion with friends of old standing. With characteristic dislike of pretence and convention he left instructions that the time and date of his funeral were not to be published and so his passing was witnessed only by a small group of his old friends, most of whom dated their friendship back to student days. He leaves a widow and two children with whom and his many friends much sympathy is felt.

C. P. L. and H. T. A. write: Arnold Jones had a record of long, efficient and unselfish service to the Royal Man-

chester Children's Hospital. He regularly attended the out-patients on two days a week until his recent illness and also had ward duties and operations on other days. He made a special investigation into the tonsil and adenoid services of a children's hospital, and expressed his views in the *British Medical Journal* of February 1931. His election to the Board of Governors was a mark of recognition of his special interest in the welfare of his patients and of the value of his services as an administrator. 'Jimmy' was a stimulating colleague, strong in his convictions and fearless in his pursuit of them, a loyal friend, and one who will be missed by his patients and their parents and also by his fellow medical men, many of whom were indebted to him for professional services to themselves or their families.

F. GARLAND COLLINS, M.R.C.S. D.P.H.

Medical Officer of Health for West Ham

The county borough of West Ham has suffered a grievous loss by the death of its medical officer of health Dr Francis Garland Collins at the age of 55. He succeeded Dr Charles Sanders the first full time M.O.H. (who is still living) in 1924, and under his regime the public health department has made great progress. Dr Collins gave the whole of his professional life to the service of West Ham after qualifying M.R.C.S. L.R.C.P. and filling a house appointment at the London Hospital. In 1907 he entered the service of the old West Ham Guardians as assistant medical officer at Whipps Cross Infirmary under the superintendency of Dr Muir. Three years later he became an assistant medical officer at Plaistow Fever Hospital, and in 1913 was appointed tuberculosis officer for the borough, after having served for a short period as assistant school medical officer. He did valuable work in the former capacity until 1915, when he joined the R.A.M.C. in which he attained the rank of major. He served throughout the period of the war at a military hospital in England, and later in Salonika and with the Serbian Forces. On his return he resumed work as tuberculosis officer, and in 1924 was selected from a long list of applicants for the position of M.O.H. for West Ham. He pursued a progressive policy in all branches of public health work, especially in the development of maternity and child welfare service which under his enthusiastic guidance, has reached a high state of efficiency in the borough.

To the many schemes involved by the Local Government Act 1929, Dr Collins brought a stimulating and vigorous mind. His activities backed by a progressive council which does not stint its public health service have borne fruit in many directions and on more than one occasion have elicited commendation from Government Departments. Under his supervision a remarkable improvement has been achieved in the matter of infant mortality. When he took office in 1924 the infantile death rate was 78 per thousand, last year it was 45. The maternal mortality rate has also shown a gratifying decrease and last year was the subject of comment by the Minister of Health in the House of Commons who pointed to West Ham as an example in this respect to the rest of the country. Ante-natal and post-natal work claimed a large share of Dr Collins's attention and besides the four council clinics in the borough others run by independent organizations are subsidized by the Corporation. Dr Collins was also school medical officer a plus of service which is regarded as one of extreme importance in the borough. He joined the British Medical Association

tion in 1910 and was chairman of the Stratford Division in 1927-8 and its representative at the Annual Meeting of 1930

Dr Collins contracted dysentery on war service, and during the last few years had been in poor health, for the last five months he was confined to bed. The funeral took place on March 31 in the presence of a large and representative gathering at Buckhurst Hill Churchyard Essex.

RICHARD WHITTINGTON, M.D.

It is with regret that we have to record the death of Dr Richard Whittington at Hove on March 30 at the age of 68. Dr Whittington was educated at Kings College London afterwards proceeding to Merton College Oxford and St Thomas's Hospital. He took his M.A., M.D. and B.Ch. at the University, and the M.R.C.S. and L.R.C.P. Lond. and later settled in practice at Brighton. He was for many years a loyal member of the British Medical Association and held the posts of chairman of the Brighton Division 1922-3 representative at Oxford last year, and at the annual meeting at Brighton in 1913 was vice president of the Section of Climatology and Balneology. Dr Whittington took a very active interest in the local government of the town, and was a member of the Brighton Education Committee and later of the Hove Education Committee of which body he was chairman for three years. He was an alderman of the East Sussex County Council and also served on the Brighton Board of Guardians. His activities in social matters were very numerous. He was chairman of the local branch of the N.S.P.C.C. a governor of the Brighton and Hove Grammar School of the Brighton Technical College of the Brighton School of Art of the Hove County School for Girls and of the Brighton Girls Club. Dr Whittington was physician to the Hove Hospital and consulting physician to the Brighton Municipal Hospital. He wrote only occasionally his articles including a paper on Prophylactic Measures against Enteric Fevers in Armies (*Treatment* 1902) and Stimulation of Abdominal by Thoracic Disease (*Lancet* 1907). He had served as a civil surgeon in the Boer War and during the great war was a major in the R.A.M.C.(T). He married Miss Ridsdale who was a sister of Mrs Stanley Baldwin and daughter of the late E. L. J. Ridsdale of Rottingdean. His wife died some years ago and Dr Whittington leaves one daughter.

Dr Whittington was of a singularly retiring nature, loyal, trustworthy and courteous. His death leaves a gap in the ranks of his colleagues which it will be difficult to fill. If there was one characteristic in him which especially predominated it was his scrupulous accuracy and care for details. He would sign no document till he was fully aware of its contents. His standard of honour and truthfulness was very high; he was absolutely to be trusted in any statement he made or in any work he undertook. Only less than twenty-four hours before the start for the Annual Meeting had to be made one of the Brighton representatives was taken ill and Dr Whittington, at this short notice, took his place. His colleagues knew they could trust him to carry out his duties with care and skill and they were not disappointed.

DAVID JAMES WOOD, M.B., C.M.

Ophthalmic Surgeon, New Somerset Hospital, Capetown.

News has reached this country of the death on March 18 at Capetown of Dr David James Wood for many years a leading ophthalmologist and a well known figure in the medical world of South Africa. A native of Scotland, he was educated at Edinburgh Royal High School and the University of Edinburgh graduating M.B., C.M.E.d. in 1888. After three years as house surgeon to the Royal London Ophthalmic Hospital he went out to South Africa and settled in Capetown as an ophthalmic surgeon becoming lecturer in ophthalmology at the University and a member of the visiting staff at the New Somerset Hospital.

Dr Wood has a long and honourable record in the British Medical Association; he was honorary secretary of the Cape of Good Hope Branch from 1895 to 1911, then for two years a member of the Branch Council; in 1905 he held office as vice president of the Cape of Good Hope Western Branch and in 1906 was elected president. From 1902 to 1915 he served as a member of the Colonial Medical Council and again in 1922 to 1925, and from 1928 to 1933 he was a member of the Union of South Africa Medical Council. During the war he held a commission as major in the South African Medical Service. He maintained contact with fellow workers in his specialty by membership of the Ophthalmological Society of the United Kingdom.

ROBERT GORDON MCKERRON, M.D.

Dr Herbert R. Spence writes:

In the *Journal* of April 3 appeared an excellent account of the career and delightful personality of Professor McKerron whose death is a severe blow to his many friends. I would like to add a few words on his obstetrical and gynaecological work. He published in the *Obstetrical Transactions* two valuable papers on Antero-posterior Positions of the Head as a Cause of Difficult Labour and on Suppression of Urine after Labour and in 1897 the most important treatise on the subject up to that year on Obstruction of Labour by Ovarian Tumour in the Pelvis. This he enlarged and published in 1903 as a small octavo volume of 282 pages under the title of *Pregnancy, Labour and Childbed with Ovarian Tumour*. As the author of this work which is a classic McKerron's name will endure for ever; subsequent writer on the subject must refer to it. It is based on a series of 1290 cases 704 of which had been collected by the author and is a monument to his industry, wide reading, sound judgement and clear statement. As an old friend of nearly fifty years standing I am anxious that this *maumet opus* should appear in the record of his life's work.

on the subject. It was for these contributions to surgical progress that he was awarded the Liston prize by the Edinburgh College of Surgeons, a distinction which gave him great and legitimate satisfaction.

As a surgeon Malcolm was methodical and painstaking and he never attempted any spectacular or ultra-rapid technique. He appreciated, earlier than many of his contemporaries, the great importance of complete haemostasis and his diagnosis was founded on such careful investigations that he was rarely confronted at operation with an unforeseen difficulty. If he had a fad it was an inveterate hostility to the vermiform appendix, and he rarely missed an opportunity of removing it when doing any kind of laparotomy. It was said at one time (and probably truly) that there was only one member of his household in Wimpole Street whose appendix had not been removed. He was in many ways the typical Lowland Scot of Anglo-Saxon origin: fair hair, yellow beard, somewhat frosty and very blue eyes, cautious and canny, almost shy and outwardly not an easy man to know, but when one got through his shell of Scottish reserve a very loyal friend with a strong sense of pawky humour, and very definitely a gentleman.

Dr JOSEPH PEREIRA GRAY, who died recently at his home in Northernhay Place, Exeter, at the age of 68, had been in practice in that city for about forty years. His health had been failing for the last five years. He studied medicine at Charing Cross Hospital, and in 1894 qualified M.R.C.S., L.R.C.P. In 1903 he graduated M.D. Brux with honours. Besides conducting a large private practice he had been honorary surgeon to Exeter Dispensary for a quarter of a century, serving on its committee, and being subsequently elected consulting surgeon. He was well known and highly esteemed in the public life of the city, his appointments including those of police surgeon, visitor to licensed houses under the Lunacy and Mental Deficiency Acts, and medical officer to the City Hospital, the Exeter Children's Home, and the Southern Railway. He helped to found the Exeter City Division of the St. John Ambulance Brigade in 1901, which awarded him its long service medal, and the St. John Ambulance Association elected him an honorary life member in recognition of his services as lecturer and examiner. Dr Gray was also a member of the Medico-Legal Society, the Royal Medico-Psychological Association, and the Devon and Exeter Medico-Chirurgical Society. For many years he had represented the Exeter Division of the British Medical Association on the local committee of the Queen's Institute of District Nurses, and had been surgeon to the Exeter Lying-in Charity. He represented the local medical practitioners on the Exeter Insurance Committee, and contributed articles to various medical periodicals from time to time on clinical and administrative topics. He joined the British Medical Association in 1904. He is survived by his widow and by two sons, both of whom are in medical practice in Exeter.

The death is announced of Professor GASTON MICHEL, at the age of 62, after an acute illness. He was professor of clinical surgery at the Faculty of Medicine of Nancy, and an associate member of the French Academy of Surgery. He was president of the French Surgical Congress in 1935, when his address on the moral traditions of surgery made a profound impression on his audience.

The death is announced at Saint Germain, at the age of 71, of Dr PECKER, the founder of the system known as Assistance Scientifique à Domicile. This system, which since its institution has been copied by many communities, began with maternity and child welfare at home in country districts. Its success in this field having been assured, its activities were later extended to medical and surgical as well as to obstetrical cases, and some time after the war the system was expanded to include syphilis and tuberculosis.

Universities and Colleges

UNIVERSITY OF OXFORD

In a Congregation to be held on May 4 it will be proposed that Mr G. R. Girdlestone be constituted Nuffield Professor of Orthopaedic Surgery, while holding the office of clinical director of the Wingfield Morris Orthopaedic Hospital, subject to the general conditions laid down in December 1936 with special provisions permitting him to engage in private practice but not to receive emoluments as professor. It will also be proposed that Professor J. A. Gunn be constituted Nuffield Professor of Therapeutics while holding the office of director of the Nuffield Institute for Medical Research, subject to the general conditions of December 1936 with special provisions for a stipend of £1,200 a year and for the decree to come into operation on the day when he ceases to hold the Chair of Pharmacology.

UNIVERSITY OF CAMBRIDGE

The appointment is announced of S. D. Elliott M.B., B.S. (Lond.) as university demonstrator in the department of pathology for three years from April 1, 1937.

UNIVERSITY OF LONDON

ROYAL CANCER HOSPITAL (FREE)

The following candidates have been approved at the examination indicated:

ACADEMIC POST-GRADUATE DIPLOMA IN MEDICAL RADIOLOGY—
Part I: I. A. Abou Sinna, P. Arunachalam, C. S. Chatterjee, Phyllis M. Fraser, D. W. Smithers, R. C. W. Staley.

UNIVERSITY OF SHEFFIELD

The following candidates have been approved at the examination indicated:

FINAL M.B. CH.B.—Parts II and III: *Margaret G. Bell, †R. W. Elliott, †S. Schultz, †D. Shapiro, †† B. Sneddon, S. R. Adlington, G. K. Burton, H. Cullumbine, S. Dalliah, Khalil A. Naylor, M. J. Pivawer, G. E. Robinson.
* With first-class honours. † With second-class honours.

UNIVERSITY OF ABERDEEN

At the spring graduation ceremony on March 31 the honorary degree of LL.D. was conferred on Mr. Naughton Dunn M.A., M.B., Ch.B. (Aberd.) surgeon and lecturer in orhopedic surgery in the University of Birmingham.

The following diplomas were conferred:

D.P.H.—R. Fraser, S. T. G. Gray.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Lectures

Professor Philip Wiles M.S., F.R.C.S. will deliver a Hunterian Lecture on "Postural Deformities of the Antero-Posterior Curves of the Spine" in the theatre of the College, Lincoln's Inn Fields, W.C., on Monday, April 12, at 5 p.m.

Two Anis and Gale Lectures on "The Anatomical and Physiological Relations of the Hypothalamus and Pituitary Gland" will be delivered by Dr. John Beattie in the theatre of the College on Wednesday, April 14, and Friday, April 16, at 5 p.m. each day.

SOCIETY OF APOTHECARIES OF LONDON

*The May examinations for the Diploma of the Mastership of Midwifery will be held on Tuesday, Wednesday, and Thursday, May 18, 19, and 20, instead of on the dates previously announced. This change is necessitated by the fixtures of the Gynaecological Visiting Society for the following week.

BRITISH COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS

The following candidates have been awarded the Diploma of the College after examination: P. H. R. Anderson, W. G. Bigger, P. G. Buxton, Jane O. French, E. S. Gawn, V. W. Gerrard, R. E. Hiron, C. W. C. Karran, Max F. St. J. U. Villar, G. P. Milne, Elizabeth M. Newham, J. C. Payne, Margaret F. Robertson, Sophie Schiller, R. Sinha, Doris E. Stewart, C. Tetlow.

Medico-Legal

SILICOSIS IN COAL MINES

By workmen's compensation law the various symptoms due to the inhalation of silica dust are treated as an injury caused by accident arising out of and in the course of employment. The Workmen's Compensation Act 1925, provided by its Section 47 that the Secretary of State might draw up a scheme for the payment by employers of compensation to workmen who suffered in this way. Accordingly various schemes have from time to time been drawn up. They work smoothly thanks to the active co-operation of the members of the industries and nearly eliminate litigation. Mr Paul C. Davie read an interesting paper on them to the Medico Legal Society on February 25. The Various Industries (Silicosis) Scheme, 1931 provides that if a workman has been employed in any of certain processes for not less than five years his disease shall be deemed to be due to employment in those processes unless the employer proves the contrary. Various processes are set out in subparagraphs including drilling or blasting in stone in coal workings, handling or moving stone at the workplaces and operating any machine used for drilling, cutting, ripping or breaking stone in a coal mine. The particular subparagraph dealing with these processes has a proviso that the employer shall not be liable if he can prove that the workman during the employment to which the disease is attributed, has not been exposed to the dust of silica rock. In 1934 this scheme was amended by the addition of another process any operation in any coal mine.

House of Lords Judgement

In the case of *Wragg v. Samuel Fox and Co. Ltd.* tried on March 15 by the House of Lords, a workman was employed for a considerable time on heading and ripping underground and became totally incapacitated through silicosis. He applied for compensation in August, 1935 and in November the county court judge awarded compensation finding that he was constantly exposed to silica dust at his work and that the silicosis was due to the nature of his employment and could not have been contracted in any other way. He found however that the appellant had not been exposed to the dust of silica rock. The employers appealed saying that the new process 'any operation underground in any coal mine' must be subject to the proviso attached to the old processes in coal mines that the employer shall escape liability if he can show that the workman has not been exposed to the dust of silica rock. The Court of Appeal allowed this contention, but on March 15 the House of Lords declared that it was wrong. Lord Thankerton in whose judgement the other Lords concurred could not see any justification for this construction. The new process, he said must clearly be an additional subparagraph and was not to be included in the subparagraph which had the proviso attached to it. Accordingly the House held that the workman was entitled to compensation.

The point is a narrow one but the decision clearly shows that when a workman contracts silicosis in any employment underground in a coal mine he will be entitled to compensation even if the employer can prove that he has not been exposed to the dust of silica rock.

ANOTHER WARNING

Medical men in the North of England should beware of a person named Eaton Jones who has recently been calling upon doctors and dentists in the neighbourhood of Liverpool and offering them for sale a liquid preparation called *luminex* which he says will coat instruments and prevent them from rusting. He purports to represent The Metallurgists Company but in the course of cross-examination in recent court proceedings

he admitted that his wife was the head of the firm that he was her manager that they had no factory and did not employ a metallurgist and that he had frequently changed his address. His tactics have been to get doctors to sign order forms on a representation that the goods are supplied on trial, that repayment will be made if they are not satisfactory, and that he desires to introduce an important new product and not to force sales. When the doctor has signed the form it turns out to contain the printed term 'Cash on delivery'.

Unfortunately for him after succeeding with a certain number of doctors, he caught a couple of Tartars in Dr Hugh Smith and Dr D. L. Charters of Birkenhead. Dr Smith whom he had the hardihood to sue in the Birkenhead County Court on February 25, claiming £1 ls said that he had agreed to take a bottle but had refused to pay cash. Jones had asked him to sign a form to show that he had called and he had done so. On receiving a letter from Jones next day he left instructions at his surgery not to take delivery. Dr Charters said he agreed to buy a bottle, but noticed that the order form was made out for two bottles instead of one. Jones told him that it was to show that he had called and he could give the preparation a trial. He took a pair of disused forceps and coated them on one side but three days later noticed that a deposit was beginning to appear on the coated side. Jones denied that the order forms had been obtained by a trick but agreed that he had told Dr Charters of a three year guarantee and had filled in the order form for two bottles and the doctor had altered it to one. The test with the forceps was not a fair one, he said because the doctor had not cleaned them before applying the liquid. Judge Whitmore Richards dismissed the claim saying he was satisfied that Dr Smith declined to give the order or receive the goods and Dr Charters had purchased a bottle conditionally on trial. He added 'I am sure the public will appreciate the public spirit shown by the doctors in defending this action. It would have been far cheaper and far easier for them to have paid their guineas but I think they felt it was a public duty to refuse. Other Birkenhead doctors have paid up their guineas rather than go to the trouble of defending this man's impudent claims, but the judge's words may deter him from issuing any more summonses in that neighbourhood.'

Medical Notes in Parliament

The House of Commons resumed after the Easter Recess on April 6 and on that day gave a second reading to the Special Areas (Amendment) Bill. Documents presented to the House of Commons on the same day include accounts of the income and expenditure of the General Medical Council and of the Branch Councils for 1936; accounts of the income and expenditure of the Dental Board of the United Kingdom for 1936; annual report of the General Board of Control for Scotland for 1936; Unemployment Assistance (Periods of Occasional Sickness) Rules 1937.

The House of Commons Standing Committee on Scottish Bills will consider on April 13 the Methylated Spirits (Scotland) Bill.

Factories Bill in Committee

Consideration of the Factories Bill was resumed by a Standing Committee at the House of Commons on March 23. On Clause 38 (power of court of summary jurisdiction to make orders as to dangerous conditions and practices) Mr RHYS DAVIES moved to substitute the words 'risk of bodily injury' for the words 'danger to life' in the subsection which provided that a court or a justice might on an ex parte application by an inspector, prohibit the use of any works machinery,

or plant or the carrying out of any process or work involving imminent danger to life until a complaint had been heard and determined. The word shall was also substituted for the word may in the provision enjoining the court to issue orders under this clause. The committee accepted the clause as amended. Clause 39 (power of court of summary jurisdiction to make orders as to dangerous factory) was added to the Bill.

On Clause 40 (supply of drinking water) Mr BURKE moved to add a proviso that at every point of supply of water a reasonable number of clean drinking vessels should be provided and maintained when the supply of drinking water did not consist of a drinking jet. Mr GEOFFREY LLOYD agreed that it was important to have proper supplies of drinking vessels. Provisions similar to those in the amendment were contained in the Drinking Water Welfare Order which had wide application to factories but not to small factories. He suggested that the amendment moved by Mr Burke should be altered to read:

Except where the water is delivered in an upward jet from which the workers can conveniently drink, one or more suitable cups or drinking vessels shall be provided at each point of supply with facilities for rinsing them in drinking water.

The amendment was accepted and the clause as amended was added to the Bill.

WASHING FACILITIES

On Clause 41 (washing facilities) Mr MANDER moved to apply to all factories the provisions which the Bill would authorize the Home Secretary to order to be made for washing facilities in factories where dust or dirt was given off in the process or the materials were dirty or offensive in nature and a special need thereby existed for washing facilities. Mr Mander said the provision of washing facilities should be applied in every factory with not less than twenty employees. Facilities ought to include soap, towels, hot water and running water. Sir ERNEST GRAHAM LITTLE said washing was essential not only in factories where dirty or offensive materials or processes were used but in factories where cleanliness was of paramount importance—for example in the preparation of food. If the Minister accepted the requirements suggested by Mr Mander Sir Ernest proposed to move an amendment deleting the word washing and substituting the word cleansing.

Mr GEOFFREY LLOYD said that under the Dangerous Trades Regulations and Welfare Orders washing facilities were provided in a very large number of industries and the clause was an attempt to give a quick method of extending washing facilities but after listening to the views that had been expressed he thought the Government ought to consider the matter with a view to bringing forward wider proposals. If Mr Mander would withdraw his amendment the Home Office would go into the matter before the report stage and undertake to widen the clause. Mr BROAD was not prepared to agree to the amendment being withdrawn. No one had the right to employ an individual from morning until night unless facilities were provided for washing. People did not realize like those who were engaged in workshops the prevalence of boils, carbuncles and skin diseases which were due to lack of washing facilities.

Mr Mander's amendment was then negatived and on the motion of Mr Short the committee accepted amendments to ensure that the provision made for washing should include a sufficient supply of soap and clean towels conveniently situated. The clause was then added to the Bill.

PROTECTIVE CLOTHING

On Clause 42 (accommodation for clothing) Mr MANDER moved an amendment to apply the clause to all factories and not merely to those covered by an order of the Home Secretary. He said that workers could arrive soaked through at any factory whatever the process. Mr LLOYD said he was prepared to approach this proposition in the same spirit as he had the previous clause but the difficulty was in the case of workers such as men in the building trade who moved about in the course of their work. He would examine the

amendment before the report stage. Mr VIANT said it was not uncommon for men working on buildings to have no facilities for storing their clothing. Men on buildings ought not to be expected to work in wet clothes. Rheumatism was prevalent in the building trade. The amendment was withdrawn.

Mr ALFRED SHORT moved an amendment to provide that suitable protective clothing in a clean condition should be provided by the occupier and worn by the persons employed. He said that in many industrial establishments this practice was followed with good results. Mr LLOYD said the Government accepted the principle that protective clothing should be provided in all proper cases but that could be done under the dangerous trade regulations and welfare regulations to be made under Clause 45. Mr Short's amendment would require protective clothing to be worn where the workers took off a good deal of their indoor clothing because of the heat and it would be unreasonable to require them to wear protective clothing instead. In industries such as laundries, cement works etc., where the Home Secretary required provision of protective clothing the Home Office specified exactly the clothing to meet the particular case. It was better that the Home Secretary should have power on the advice of factory inspectors to lay down exactly what protective clothing was needed. Mr Short withdrew his amendment and the clause was added to the Bill.

SITTING IN FACTORIES

On Clause 43 (facilities for sitting) Mr GRAHAM WHITE's motion to leave out the word female so that the provision should apply to both sexes was negatived. Mr BROAD withdrew an amendment drafted to ensure that the use of seats should be permitted to female workers whenever this did not interfere with their work. Mr MANDER pointed out that the clause did not refer to seats but to suitable facilities for sitting. Mr LLOYD said the floor would not be regarded as a suitable facility for sitting. The phrase suitable facilities for sitting was used because in some factories the facility was in the form of a short hammock between pillars. It was unnecessary to ensure that the employer should allow the use of seats as had been done in the Shop Act because in the latter case employers thought that the public did not like to see the seats in use. The Factory Department had no evidence that such a prohibition had ever occurred in factories.

On a motion that the clause stand part of the Bill Mr FLEIS SMITH hoped that the Home Secretary would reconsider the clause to permit a more generous interpretation. Progressive employers now provided facilities for female employees to look after one another. Mr BROMFIELD said secretaries of textile trades unions could forward Mr Lloyd many complaints of refusal to allow the use of seats. He himself had known cases of young women who had been discharged for sitting down during working hours. Mr LLOYD replied that frequent refusal to allow female workers to use the seats provided would be an offence against the clause as it stood. The provision of rest rooms was possible in special industries under Clause 45. The clause was added to the Bill.

On Clause 44 (first aid) Mr BROAD moved to leave out the restriction to factories using mechanical power of the provision of first aid boxes. He said many dangerous operations were done in places where mechanical power was not used and where minor injuries might lead to septic poisoning. Mr LLOYD said that in factories where mechanical power was not used but where dangerous operations were done and there was special risk first aid boxes could be required under the safety or welfare regulations and the Home Secretary would require provision to be made. Mr BROAD withdrew his amendment.

Sir ERNEST GRAHAM LITTLE moved to provide that the first aid box or cupboard should be examined annually by a factory surgeon. He said the absence of adequate first aid was a fruitful cause of serious accident. He had a second amendment to ensure that persons could be available who were competent to use the first aid appliances and a third one that in

appliances should be in the charge of a person possessing a certificate of first aid. Mr LLOYD said the Home Office did not think it necessary that the first aid boxes should be examined by a surgeon. Their contents would be prescribed in detail by the Home Secretary and it was easy for the Factory inspectors to make certain that the right ingredients were in the boxes. There was not a great risk of deterioration of the contents of the boxes for a reasonable period and he would look further into the question of examination of the aseptic parts of dressing. In a large factory it might be reasonable to have someone proficient in first aid although the Home Office would advise that a reasonable person which was the term used in the Bill, would be capable of dealing with most of the minor first aid assistance necessary. If the amendment was withdrawn he would reconsider the question. Sir Ernest withdrew his amendment and the clause was added to the Bill.

On Clause 45 (welfare regulations) a discussion arose on the co-operation of the employees in welfare arrangements and after an amendment had been withdrawn the clause was added to the Bill.

Consideration of the Bill was then adjourned till April 8. Sir JOHN SIMON remarking that the committee had made good progress and he hoped to get the committee stage over before the Whitsuntide adjournment. The report stage of the Bill on the floor of the House was going to be important and he would be sorry to see it rushed.

Coroners No Legislation this Session

On April 6 Mr A EDWARDS asked Sir John Simon whether in view of statements recently made by coroners which seemed to be outside the function of a coroner he would consider expediting action on the report of the Departmental Committee which deplored the tendency of coroners to make animadversions on the character and conduct of individuals. Sir JOHN SIMON said there was no prospect of an opportunity being found during the present session for any legislation on the subject of coroners. He did not think there was any action which could conveniently be taken meanwhile to deal with particular recommendations included in the committee's report. He had no doubt that coroners had noted the recommendation in the report on the point referred to.

Health of Recruits—On April 6 Mr ERNEST BROWN told Miss Irene Ward that the results of the Aldershot experiment on recruits below the required standard for acceptance in the Army were being examined by his Department to see whether they pointed to the need of modifications in the treatment of unemployed men applying for a course of training.

Medical News

The spring dinner of the Queen's University Club, London will be held at Dorchester Hotel on Thursday April 22. Further information can be obtained from the secretaries 101 Harley Street W1.

Mr T Macara FIC, will lecture on Science and the Conservation of Food. Some Special Problems at the Royal Institution 21 Albemarle Street W on Friday, April 16 at 9 p.m.

The one hundred and seventeenth annual general meeting of the Hunterian Society will be held at Simpson's Restaurant Cheapside EC on Monday, April 12 at 7.15 p.m. After the business of the meeting is concluded a discussion on Air Raid Precautions will be opened by Dr L. Haden Guest.

The Society for the Propagation of the Gospel will hold its medical mission meeting in Caxton Hall, Westminster on Thursday April 15 at 3 p.m. The speakers include Drs K. E. D. Dauncey and F. S. Drewe who will give an account of their work in India and Africa respectively.

The British Health Resorts Association has arranged a conference at Skegness on Saturday, April 17. The programme includes a discussion on Industry and the Health Resort to be opened by a well-known employer, followed by Mr Ernest Bevin and by Dr Leonard P. Lockhart of Nottingham. There will also be a discussion on Games Sport and Sea Bathing in Relation to Health to be opened by Sir Kaye Le Fleming followed by Dr R. Cove Smith and Dame Louise Mellroy.

The annual medical congress at Lille will be held from May 7 to 9. Further information can be obtained from the Secretary Faculté de Médecine Rue du Port 56 Lille.

The sixth Italian Congress of Colonial Medicine and Hygiene will be held at Florence from April 12 to 17 under the presidency of Sir Aldo Castellani.

A tour in Sardinia organized by the Italian journal *Rassegna Internazionale di Clinica e Terapia* will take place from April 27 to May 9. The cost will be 400 lire. Further information can be obtained from *Rassegna Internazionale di Clinica e Terapia* Via San Felice a Piazza Dante Naples.

The paragraph of Irish news published last week (p. 729) stated correctly that Colonel Thomas Sinclair C.B. F.R.C.S. M.P. who has been reappointed Crown Nominee for Ireland on the General Medical Council has served in that capacity since May 1927. It should be added that Colonel Sinclair previously represented Queen's University, Belfast on the G.M.C. for more than eight years.

During the evening service at 5.30 p.m. on Sunday, April 18 in King's College Hospital Chapel a plaque will be unveiled to the memory of Dr Harold Wiltshire formerly one of the physicians to the hospital. At the same service the endowment of a bed in memory of Mr Albert Carless who was actively associated with the medical school and hospital for nearly forty years will be offered by his wife, and the address will be given by his friend, the Rev. Howard Banister, vicar of Wallington, Surrey.

The programme has now been issued of the celebrations of the centenary of the Medical Society of Vienna which will cover the period from May 19 to 29 and will be under the patronage of Chancellor Kurt von Schuschnigg. In addition to a large number of addresses and clinical demonstrations relating to all branches of medicine and surgery there will be numerous receptions in connection with kindred societies and also other social functions. Application for the copies of the programme should be addressed to the Kursbüro der Wiener Medizinischen Fakultät Allgemeines Krankenhaus, Vienna IX.

The National Radium Commission is to provide Bradford with a gramme and a half of radium, the estimated value of which is £12,000. The gift will ultimately pass to the Bradford Radium Institute which is to be built in the grounds of the new infirmary at Daisy Hill.

It was reported at the last quarterly Court of Governors of the London Hospital that in 1936 the total amount received at the hospital from in-patients and their societies reached the record figure of £46,264. It was stated that the new wards for patients of moderate means would probably be ready in the autumn.

The issue of *Le Bulletin Médical* for March 13 contains an appreciation of London hospitals by the well known Paris surgeon M. Andre Sicard.

Professor Fedor Krause the Berlin specialist in surgery of the brain, celebrated his eightieth birthday on March 7.

Mr Philip Franklin F.R.C.S. has been elected honorary vice-president of the American Institute for the Deaf-Blind.

The quinquennial prize of 30,000 francs of the Belgian Government for the best book on medical science has been awarded to Dr Heymans.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B.M.A. HOUSE TAVISTOCK SQUARE W.C.1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House Tavistock Square W.C.1 on receipt of proofs. Authors over seas should indicate on MSS if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

THE TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

QUERIES AND ANSWERS

Wanted—A Patient with a Biliary Fistula

"X X X" asks us to publish the following request. I am anxious to find a patient with biliary fistula who would be willing to come to Harrogate to have some investigations done on the effect on the liver secretion of the various waters here. All expenses, etc. would be paid for anyone suitable.

Replies from medical practitioners will be forwarded to "X X X" at Harrogate.

Broken Sleep in Middle Age

"RELIEVED" writes. With reference to the question by Sussex on page 649 of the *Journal* for March 20 I think my own case may interest your correspondent. I am 46 years of age and had exactly the same trouble with no symptoms by day. Vague abdominal discomfort and some flatulence at night led to investigation by barium meal. This revealed a small gastric ulcer, some degree of enteropneumosis and a diverticulosis. Treatment by bismuth and sodium bicarbonate and liquid paraffin together with gastric ulcer diet, no alcohol and little tobacco has resulted in an almost complete cure of the broken nights after about six weeks. In my case the condition had grown gradually over a period of about eighteen months until I woke quite regularly at 4 a.m. every morning.

Sleep Rolling

"CHATHAM" sends the following reply to J.M.C. (March 27 p. 694) who asked how to cure his small boy of a habit of rolling from side to side in his sleep. I would suggest that a hammock should be tried. A naval sick berth attendant assures me that rolling in a hammock is physically impossible.

Income Tax

Replacement of Car

"T.H."—to whom a reply was given in our issue of September 12, 1936—asks how the expense of replacement of a car should be treated in his practice accounts.

As depreciation was charged year by year the special amount to be charged on replacement is the excess of the original cost of the car over the sum of (a) the aggregate of the allowances and (b) the amount realized for the sale of the car. In this case the car was given to a friend and consequently the amount to be substituted for the sale price is either the sale value or the balance of the written-down value—that is, cost less (a) above—whichever is the less.

Legal Defence Expenses

"X X X" was tried on a charge of perjury for medical evidence given with respect to an accused person. The case was stopped by the judge and an acquittal recorded. The pro-

fessional defence society bore part of the cost of the defence but X, X had to bear about £800. Can he treat that sum as a professional expense?

It is assumed that the evidence in question was given with regard to a patient or in some other way arose out of professional work. If so it seems clear that the cost of the defence in so far as it was borne by X, X should be regarded as an expense incurred in carrying on his practice. Where costs etc. are incurred in an unsuccessful defence against a criminal or quasi-criminal prosecution—for example, a fine on a trader for selling short weight—they are refused on the ground that the fine and costs are personal and are intended to be wholly borne as a punishment. That ground for refusal of the deduction does not apply to this case.

LETTERS, NOTES, ETC

Premedication in Minor Surgery

Dr M. J. PETTY (Buenos Aires) writes. Local anaesthesia in minor surgery has reached a considerable state of perfection but it is remarkable that premedication has not been insisted upon in this connexion. In the first place, in the most frequent minor surgical operations such as those carried out by dentists when with their drills they grind into the delicate nervous system of our teeth if they only troubled to recommend the taking of one or two aspirins five or ten minutes before submitting their patients to such distressing manœuvres they would earn gratitude. I have found that after taking one or two aspirins five to ten minutes before sitting in the dentist's chair I remained perfectly quiet for over an hour without tightening up my muscles or screwing myself into awkward positions during the drilling of my teeth. The last time this occurred the dentist remarked upon my passivity. Since using some mild premedication just before minor surgical procedures such as cystoscopy or the administration of local anaesthesia etc. I have been impressed by the tolerance shown by the patient.

Prevention of Peritoneal Adhesions

Dr SYDNEY PERN (Ballarat, Australia) writes in the course of a letter. In the *Journal* of December 5, 1936 (p. 1150) there appeared an annotation on the prevention of peritoneal adhesions. Having had considerable personal experience of abdominal adhesions I have formulated certain ideas which may be worthy of consideration. How often when an abdomen is opened are adhesions found round the region of the gall bladder and duodenum? Of a necessity these could only have arisen from bacterial infection deposited by the blood stream just under the peritonum. By now Rosenow's theory of the specific elective affinity of certain strains of organisms for particular tissues is fairly accepted. With the presence of a duodenal ulcer or infected gall bladder the organisms are blood borne but many are deposited in the surrounding tissues hence the adhesions and whatever is done in the way of operation the organisms will continue to be deposited in the same locality as long as the original focus from which the organisms are coming remains. Directly that focus is efficiently removed however all further adhesions cease and resolution of those present takes place. I can vouch for this personally. It has also been my experience to have treated several cases in which appendicectomy has been followed by great pain and disability owing to adhesion in the locality by removing infected tonsils or some other focus and applying diathermy, with eminently satisfactory results.

Traffic Light Drill

The Save the Children Fund in conjunction with the Ford Motor Company has produced an ingenious model for teaching children how the traffic lights work and therefore when they can cross the road in safety. Simple manipulation produces the three familiar colours in their order and each is accompanied by an appropriate legend. All who are interested in the safety of children on the roads may have copies of this instructive toy on application to the Save the Children Fund 20 Gordon Square London W.C.1.

Disclaimer

Mr W. E. TUCKER F.R.C.S. writes to disclaim any responsibility for the reference to an operation performed by him which appeared in the sporting columns of a London evening newspaper on March 29.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

271

Lead Poisoning

According to H. GELINAS (*Union méd Can*, February 1937, p. 164) diagnosis of lead poisoning is facilitated in children by radiological detection of lead in the juxta-epiphyseal zone of the long bones and in adults by the finding of a reticulocyte count of 2 to 40 per cent. Traces of lead (in America at any rate) appear to be present normally in the blood, urine and faeces so that quantitative tests only are valuable. In acute poisoning treatment aims at promoting fixation of lead from the circulating blood, in the bones for twenty-four to forty-eight hours 1 to 2 grammes of calcium gluconate are injected intravenously at three to four hourly intervals; this dosage is diminished during two to four days and subsequently calcium chloride or gluconate is given by the mouth. A lacto-vegetarian diet is prescribed. Subsequent elimination of lead may take up to two years; it may be accelerated—not less than a month after acute symptoms have gone and then only in hospital—by two to three days treatment at four to six weeks intervals by meat diet and exhibition of phosphoric acid and ammonium chloride. The use of potassium iodide, apart from occasional idiosyncrasy, is free from danger.

272 J. HARTMANN (*Münch med Wschr*, February 12, 1937, p. 252) stresses the importance of increased intra-colonic tension in the development of colonic diverticuli. Such increased tension occurs in chronic spastic constipation, which includes the constipation occurring in cases of chronic lead poisoning. The author then describes two such cases of lead poisoning which have gradually developed colonic spasm. He advises radiographic examination of the colon in every case of chronic plumbism with intestinal symptoms.

273 Pathogenesis of Multiple Sclerosis

B. DATNER (*Wien klin Wschr*, January 22, 1937, p. 87) attributes the conflicting theories regarding the pathogenesis of multiple sclerosis to the fact that a large proportion of obscure nervous diseases which do not belong to this category are labelled multiple sclerosis. The disease has been attributed by various authorities to chronic inflammation of unknown or specific origin, to degenerative processes, to a gliosis produced by a congenitally abnormal constitution, to trauma and to toxins such as lead. In the recent literature Datner finds researches along different lines which he believes will ultimately lead to an elucidation of the pathogenesis of the condition. (1) In the majority of cases of multiple sclerosis blood changes are in evidence. (a) A large proportion give a positive complement-fixation reaction for tuberculosis. In Datner's cases 68 per cent did so in contrast to 36 per cent of controls. (b) Lipolytic substances and high diastase values have been obtained in the blood of patients with multiple sclerosis. (c) In general the blood coagulation time is increased in this condition. (d) In a large number of cases anaemia of the hyper- or hypo-chromic type is found. (2) Datner examined the hydrochloric acid content of the stomach and found achylia or marked hypo-acidity in 31 per cent of cases (in contrast to 4 per cent among normal persons). (3) Finally Datner draws attention to marked resemblances between multiple sclerosis and the deficiency diseases. The resemblance to pellagra is seen in the frequent remissions, the greater mortality of both diseases in the north than the south, the age incidence of 25 to 45, the incidence in spring and summer, the deleterious effect of sunshine on both and the greater incidence of both in women than men. With beriberi it is seen in the deleterious effect of exercise on both and the occurrence in both of initial hyperacidity followed by achylia. All three conditions begin with polyneuritis and paraesthesiae. In all retrobulbar neuritis occurs. Spastic-

paretic and cerebellar-ataxic manifestations are common to pellagra and multiple sclerosis. The resemblance to scurvy is seen in the increased bleeding time and the early falling out of the teeth in both conditions. Datner does not believe that the identity of these various pathogenetic mechanisms is purely fortuitous, but that further careful analysis will lead to the right understanding of the pathogenesis of multiple sclerosis.

Surgery

274

Endarteritis Obliterans

W. BIRCHER (*Münch med Wschr*, January 29, 1937, p. 166) reports a case of endarteritis obliterans which had caused gangrene of the foot. The clinical investigation revealed four causative factors—namely chronic hypovitaminosis, particularly lack of vitamin C, intestinal toxæmia as a result of abnormal intestinal fermentations and constipation, abuse of tobacco, and chronic sepsis from infected teeth. A change to a predominantly vegetable diet, extraction of all infected teeth, physical therapy and the new ozone therapy improved the condition of the foot to such an extent as to render amputation unnecessary.

275

Decompression of the Small Intestine

A. OCHSNER and A. STORCK (*J Amer med Ass*, January 23, 1937, p. 260) discuss the advisability or otherwise of evacuating the contents of distended loops of intestine by performing an enterostomy and milking or stripping out the intestinal contents at the time of operation. An analysis of sixteen clinical cases of intestinal obstruction is given in which stripping was used. Ileus was due to a variety of causes, such as bands, carcinoma, faecalith, inguinal or ventral hernia, or volvulus. There were ten males and six females in the series, and of these eleven were negroes; the average age was 41 years. The duration of intestinal obstruction averaged 62.8 hours, the shortest time being twenty-four hours and the longest 120 hours. Cramping pain, nausea, and vomiting were present in nearly all cases and stercoraceous vomiting was noted in five instances. Purgation before admission had been attempted in three cases which ended fatally and of eight patients who had received enemas before admission six died. Abdominal distension was severe in most cases, with tenderness, abdominal rigidity and peristaltic activity as other common symptoms. Ten of the patients on whom some type of pre-operative gastric drainage was carried out died and two lived. Hypodermoclysis or phleboclysis was used pre-operatively in each case. Operative procedure consisted of the relief of the obstruction followed by an enterostomy, and evacuation of the intestinal contents by beginning in the region of the ligament of Treitz and stripping the entire small intestine. In certain cases the catheter was left in place after operation. The mortality rate was very high—68.7 per cent—and although the majority of patients in the group were poor operative risks, it is considered that the additional trauma caused by intestinal stripping further aggravated the ileus and caused surgical shock. Careful pre-operative preparation of patients suffering from ileus by means of duodenal decompression, replacement of electrolytes, and liberal doses of morphine, is advised.

276

Myositis Ossificans

C. ARTUS CHRISTIANI (*Lyon Chir*, January-February, 1937, p. 5) discusses the history and pathology of myositis ossificans and describes two personal cases of the disease. Traumatic myositis ossificans is an intramuscular bony formation which appears some time after the original injury. The trauma may be an external injury, a fracture or dislocation, or a sudden muscular contraction. On the other hand,

slight repeated traumatama may give rise to the disease in the thigh in cavalry soldiers, and in the biceps or in the muscles of the arm or shoulder following excessive exercise of these upper arm muscles. Ossification never arises in the muscles of the hand. It is most often seen in young people of the male sex. The thickening of the muscle usually occurs soon after the swelling caused by the injury and may be overlooked unless there is limitation of movement or pain or an x-ray photograph is taken. The growth may be joined to the bone by fibrous tissue or may be isolated in the muscle. It may vary in size from the thickness of the thumb to 20 cm. The first case described was in a man of 66 who in falling had fractured the right femur. The leg was put in extension and immobilized for three weeks. As a radiograph then showed that consolidation had not taken place and as reduction was not possible owing to a muscular growth, operation was carried out. This showed a haematoma with myositis ossificans extending into the vastus and adductor muscles. Osteosynthesis was performed but the patient died two days later from paralytic ileus shock, and uraemia. In the second case the tumour appeared in a man of 23 following a kick on the thigh from a horse. The growth increased in size until at the end of three months the knee function was affected. Operation was carried out and the tumour which was of bony consistency, was successfully removed.

Therapeutics

277 Diet in Graves's Disease

H LOHR (*Med Welt* January 23 1937, p 111) discusses the value of dietetic and vitamin therapy in Graves's disease. Both laboratory experiments and clinical experience confirm the usefulness of a diet rich in vitamins A B₁ and C to which the pure vitamins are added in cases of hyperthyroidism. The diet recommended is poor in meat. Milk and milk products are not restricted and twice weekly calf's kidney and once weekly calf's liver is given. Calf thymus once or twice weekly is also useful. The fat lipoids are supplied by olive oil almonds and nuts. On alternate days bone marrow and brain are allowed also one or two yolks of egg daily. The carbohydrates recommended are wholemeal bread porridge rice boiled potatoes in moderate quantities honey and malt extract. Vitamins A and D are supplied by yolk of egg and cod-liver oil, vitamin B by yeast extract and vitamin C by oranges and lemons also by the usual fruit and vegetables. Alcohol and tobacco are best avoided.

278 Treatment of Malignancy

SCHONBAUER (*Med Klink* February 5 1937 p 185) evaluates modern methods of treatment of malignant tumours with surgery x rays and radium by analysing in the literature the percentage of successful results achieved in tumours of various parts of the body. He points out that radiological treatment is only of value in malignant tumours of which the parent tissue is radio-sensitive. Into this category belong the seminomata folliculomata lymphosarcomata epitheliomata and carcinomata. All others are radio-insensitive unless they are anaplastic—that is completely differentiated from their parent tissue or through metaplasia converted into radio sensitive tumours. Surgical methods alone achieve success in the treatment of tumours of the brain (20 per cent.) gastro-intestinal tract (30 per cent. in radical removal) kidneys (25 per cent.) bladder (30 per cent.) and corpus uteri (60 per cent.). X ray and radium treatment is of no more value than operation in tumours of the tonsils thyroid penis testicle and bones of the extremities. Tumours of the skin are successfully treated in 95 per cent. of cases by any method. Cancer of the breast can be cured in 100 per cent. of early cases by operation but in its later stages irradiation in addition to surgery greatly improves the results. Combined surgical and radiological methods cure the sculps by 15 per cent. in tumours of the lips.

(72 per cent successes by operation alone), by 50 per cent in those of the tongue (15 per cent) and in those of the larynx and cervix uteri. Tumours of the oesophagus, gall bladder, liver, pancreas, lung, and prostate are at present outside the category of successful results by any method but the author is encouraged by the rapid strides made in radiological therapy to think that these and other inoperable tumours will eventually be successfully treated.

Diseases of Children

279 Sinusitis in Childhood

J. CROOKS and A. G. SIGNY (*Arch. Dis. Childh.* December, 1936, p. 281) state that in view of the prevalence of infection of the nose, throat and ears in childhood it is reasonable to suppose that disease of the nasal sinuses is common in early life. One hundred instances of nasal sinusitis are recorded and analysed. Any or all of the accessory air sinuses may be diseased in childhood, for these are all present in early life. The development of the sinuses and the scheme of investigation are described. The presence of inflammatory exudate in an air sinus is proved by aspirating fluid from the cavity and not by washing it out of the nose with a cannula in the sinus. Reasons which led to a decision to aspirate the antra in a series of children undergoing removal of tonsils and adenoids were that they had chronic respiratory complaints and that the antra could be easily punctured while under the anaesthetic. Only children who had a chronic infection of the upper air passages were subjected to this procedure. The technique of the puncture and the bacteriological examination of the antra are described. The main fact that emerges is that out of one hundred children having a tonsil and adenoid operation twenty four were found to have mucus muco pus or pus in one or both antra. Most of these cases cleared up with antral lavage. In children the nose is small and easily blocked and adenoids are frequent. The common conditions giving rise to sinusitis are colds influenza and infectious diseases particularly whooping cough. Bathing in infected water is another frequent cause. Sinusitis is more common in those climates where upper respiratory infections are prevalent, and is common in children who are in chronic ill health. X ray examination is a valuable aid in diagnosis and cases can be followed up by repeated examinations of this nature. A complete cure can be anticipated in most cases in several months.

280 Apnoea with Cyanosis in the Newborn

G LEBEVRE (*Echo med Nord* December 27 1936 p 1101) reports six cases of apnoea with cyanosis in the newly born. The prognosis is grave 50 per cent of reported cases were fatal. The conception of temporary failure of the respiratory centre is most generally accepted as a pathological basis. In these six cases no evidence of congenital syphilis or birth injury could be found and apart from the apnoea itself there was no indication that a meningeal haemorrhage of obscure origin was present. The children were normal and the births uncomplicated. The author postulates incomplete development of the brain stem with a temporary return to the foetal heart cycle and abeyance of pulmonary respiration following failure of the respiratory centre as an explanation of the condition. The respiratory and heart regulating centres are unstable and low temperatures in these cases have been recorded. The cerebral meningeal and visceral haemorrhages found at necropsy may be sequels to and not the cause of the apnoea. A state of atelectasis of the lung during apnoea has been observed though not in this series. Cyanosis itself a danger, actually aids recovery by stimulating the respiratory centre through excess formation of CO₂. Treatment by suspension of the infant upside down and mouth to mouth respiration acts in the same way. Between attacks anti syphilitic treatment aids infants with latent or apparent syphilis. Ultra violet rays and improvement of the general conditions are of value and some benefit was

obtained by the injection of lobeline (3 mg. daily) Oxygen inhalation and injections of camphor are useful in severe cases If meningeal haemorrhage is suspected the ocular fundi should be examined and lumbar puncture performed

281 Prognosis of Spasmophilia

J NORDENFELT (*Acta paediatr*, Stockh, vol 19, Fasc 2, 1936, p 187) has followed up a series of children who in early life had suffered from spasmophilia including tetany and convulsions The object of this investigation was to see if these children suffered from further nervous disorders such as mental defects or psychic troubles in later life The results show that there is a definite relation between spasmophilia and mental deficiency but not with epilepsy

282 Empyema in Children

F PONTIERI and F TECILAZIC (*Pediatrics*, Naples, February 1937, p 116) record their observations on seventy cases of empyema secondary to bronchopneumonia in children aged from under 1 to 10 years admitted to the Institute of Clinical Paediatrics of Milan University from 1932 to 1935 Forty-eight were boys and twenty-two girls In eight cases the empyema was bilateral In fifty-five cases twenty-four of which were fatal it was synpneumonic, and in fifteen, of which four were fatal metapneumonic In twenty-six of the twenty-eight fatal cases a necropsy was performed and showed the following phenomena (1) A tendency of the pleura to react in an unequal manner in the presence of micro organisms In some parts the inflammatory lesions were arrested in the stage of fibrino leucocytic effusion while in others there was a new formation of dense adhesions (2) Persistence of the primary lesions in the lung (3) Frequency of septic metastases especially in infants in the serous membranes parenchymatous organs and middle ear (4) Rarity of spread of the purulent collection to neighbouring organs The following methods of treatment were carried out (1) General symptomatic treatment or autovaccines (thirteen cases with four deaths) (2) Repeated aspiration without introduction of a therapeutic fluid (twenty-three cases with thirteen deaths) (3) Injection of sodium taurocholate according to Cocchi's method (twenty-two cases with seven deaths) (4) Operative treatment (eighteen cases with four deaths) The cases treated with taurocholate were chiefly infants while those which underwent operation were older children

283 Lobar Pneumonia in Childhood

S L ELLENBERG and A T MARTIN (*NY St J Med* January 15 1937, p 119) record a 5½ years clinical survey of 459 cases of lobar pneumonia in childhood Of these cases 50 per cent arose in children under the age of 4 years and only a few in the later ages of 10 and upwards The peak incidence was reached in the first years of life The greatest number of cases were recorded during the late winter months of March and April, while the fewest cases arose in July The mortality in this series was 8.6 per cent and this could have been reduced still further by an earlier admission to hospital as many children were sent in as a last resource This mortality rate compares favourably with the records of other writers The fact that the mortality is higher in children 2 years and under is also borne out by this study for the mortality in this age group is 24 per cent as compared with a mortality of 2.1 per cent in the age group above 2 years X-ray examination was useful and confirmed the diagnosis of lobar pneumonia in most cases Meningeal irritation was noted in twenty four cases and lumbar puncture showed increased pressure but no excess of cells and no organisms The five most frequent complications were otitis media, empyema meningismus furunculosis and abscesses Empyema was the most serious complication and the one most likely to influence the course of the illness Treatment consisted in the main in leaving the patient alone and in good nursing Abdominal distension needed to be carefully watched and treated with enemata at once Oxygen

is considered to be a very definite adjunct to the treatment of pneumonia, and should be used whenever cyanosis excessive restlessness, or severe toxæmia is present The old method of giving oxygen by the open method or through a nasal catheter is condemned as being of no value The oxygen tent only was used, and proved of much value

284 Folliculin in Gonorrhoeal Vulvovaginitis

R PONGRATZ (*Med Klink* January 15, 1937 p 93) has had poor results from the insertion of protargol bougies or irrigation under pressure in gonorrhoeal vulvovaginitis in children In four cases he has tried ovarian hormone treatment, as recently recommended (Hohorst and Gassmann (1936), *Derm Wschr*, 1) Folliculin was given intramuscularly in a dose of 10 000 units on the first day, and on this and twenty succeeding days dragées of 1,000 units were given orally thrice daily no local treatment was prescribed The discharge ceased rapidly, swabs were negative after the second week, and no effect on secondary sexual characteristics, such as swelling of the breasts or growth of pubic hair, was noted The treatment is said to be comparatively economical in view of the protracted course of the disease under other treatments Its purpose is to induce growth and thickening of the vaginal epithelium as well as to favour the appearance of Doderlein's lactic acid-producing bacillus—both being factors which are biologically unfavourable to the gonococcus

285 T DE SOUZA and H DA ROCHA PITTA (*Ann bras Gynec* December 1936 p 471) record their observations on ten cases of vaginitis in children aged from 2 to 9 years treated by intramuscular injections of folliculin in doses of 1 000 units daily The treatment lasted for at least a month and was sometimes prolonged for three or four months In nine of the cases gonococci were found No bad effects ensued from the use of large doses The writers came to the conclusion that in children folliculin constitutes the best treatment for vaginitis, whether gonococcal or not in origin

286 Congenital Pyloric Stenosis

P FIORI (*Arch ital Chir*, October 1936 p 389) summarizes the cases, some fifty in number, of congenital pyloric stenosis reported in Italy, he concludes that the condition is very much less common in Italy and France than in Anglo Saxon countries His own patients, four in number, all recovered—two after pyloroplasty and two after gastroenterostomy In one case diagnosed at the tenth week as congenital pyloric stenosis the operation showed unexpectedly a soft pylorus, smaller than normal together with much gastric dilatation and clear signs of a ligneous pancreatitis Here gastroenterostomy proved successful Although the possibility of a juxtapiyloric ulcer could not be excluded, this case was regarded as probably allied with Schäfer's syndrome of incomplete pyloric atresia

287 Prontosil in Paediatrics

E UNSHELM (*Arch Kinderheilk* Bd 110, Ht 2, p 76) considers prontosil of great value in the treatment of streptococcal infections in children particularly in the treatment of erysipelas, in spite of some undesirable effects of the drug Even in doses of three half-tablets a day prontosil may cause anorexia diarrhoea and exanthemata The author hopes to avoid the undesirable effects by reducing the doses

288 Epidemic Myalgia

G LINDBERG (*Acta paediatr* Stockh September 30 1936 p 1) records eighty cases of the condition variously known as Bornholm disease epidemic myalgia pleurodynia or devil's grip etc in children whose ages ranged from 7 months to 15 years The cases arose at Norrköping, Sweden between September and November 1934 and seventy occurred during the first twelve years of life and only ten during the next three years All made a complete recovery, the great majority within a few days

Obstetrics and Gynaecology

289

Urethrocele

B R YOUNG and L E MCCREA (*Urol cutan Rev*, February, 1937 p 91), who record an illustrative case in a woman aged 26 state that the terms urethrocele urethral diverticulum, false diverticulum urethral cyst and suburethral abscess have been used to describe a pouch or sac filled with fluid which originates in the female genitalia or the urethro vaginal septum. The pouch is filled with urine or pus and communicates by a narrow channel with the inferior wall of the urethra. The sac can be filled with an opaque solution and is therefore visible in the skigram at the level of the symphysis pubis just below the shadow of the bladder. The condition was first described by Sir Charles Mansfield Clarke in 1814. The aetiology is obscure but many patients give a history of a prolonged difficult labour. In nulliparous women it may be due to congenital defects of the urethra or back pressure in the urethra caused by a narrowed urethral meatus or suppurating urethral glands. The disease may occur between 5 and 60, the highest incidence being between 25 and 45. Although a number of cures have been reported after conservative treatment such as injection of sclerosing solutions (33 per cent silver nitrate or zinc chloride) operation is the treatment of choice. Simple incision usually results in complete recovery in from two to four weeks.

290

Causation of Tubal Pregnancy

P ISIDOR (*Gynecologie* December 1936, p 705) comments on the frequency with which a topographical reconstruction of the Fallopian tube containing an early ectopic pregnancy shows a double lumen with one of the canals blind at its inner or outer end. In some of his preparations histological signs of antecedent inflammation were absent and the contralateral tube showed similar malformations. A decidual reaction was not always present. A double lumen was associated with two separate circular muscular coats. Isidor concludes that the arrest of the ovum in the blind end of an accessory (congenitally present) tube accounts for a certain proportion of ectopic pregnancies. He suggests further that such deformities by interfering with drainage in the tube, may favour inflammation—the malformation far from being the result of pelvic inflammation would thus impede its resolution.

291

Dysmenorrhoea

DRS LEDA STACEY and ROSEMARY SHOEMAKER (*Amer J Obstet Gynec* January 1937 p 67) submit a study from the Mayo Foundation of 262 cases of dysmenorrhoea. 132 were single women. Pregnancy had failed to cure forty-seven out of the 130 married women. Of these, six gained relief after treatment plus a second pregnancy but six remained as before. Psychic and fatigue factors were noted in eighty-two cases. Results are tabulated according to type of treatment—(1) Drugs—antispasmodics analgesics sedatives chiefly benzyl benzoate barbiturates belladonna and calcium lactate alone or in combination. After a course of such treatment 51 per cent showed benefit some permanent. (2) Endocrines—alone or combined with drugs at least for a time primarily for cases showing menstrual irregularities. 60 per cent gained relief relapses occurring unless treatment was maintained or repeated in an uncertain proportion. Ovarian extract oestrin (prognon) placental hormone (emmenin) and sistomensin (lutco-lipoid of corpus luteum) are separately reported upon the last being chosen when excessive loss as well as pain was present. Complete relief was obtained in 54 per cent with improvement in 55 per cent but it is suggested that the endocrine preparations had very little effect. Irradiation of pituitary or ovaries was used in five cases with relief but the method is for expert radiologists only. Radium in doses to induce temporary menorrhoea or full menopause applied in sixteen selected cases was successful in 69 per cent. For patients with

disabling and otherwise incurable dysmenorrhoea resection of the pre sacral nerves is a possibility relief being considerable and generally complete.

Pathology

292

Active Immunization against Tetanus

P J GROULIER (*Thèse Paris* 1937 No 69) states that active immunization against tetanus was first carried out by Vallee and Louis Bazy in 1917 during the great war, when serum prophylaxis was sometimes ineffective. Although the latter is of considerable value in the campaign against tetanus it presents the following drawbacks. (1) In the case of wounds there is no hard and fast rule as to when serum should be given. (2) Repetition of the injections causes an increasingly rapid elimination of the serum and its efficacy progressively declines. (3) The action of serum is immediate but is of short duration. On the other hand the active immunity conferred by the use of vaccines though it is slow in developing lasts a considerable time. It is not permanent however, and requires to be regularly kept up by further injections once a year or on the occasion of any wound. The method of producing active immunity consists in giving three injections of 2 ccm of formol toxoid at three-weekly intervals. There are no objections to combining anti tetanic with anti diphtheritic or anti typhoid vaccination. Injections of tetanus anatoxin are not followed by any severe reaction. They can be repeated indefinitely and the more they are repeated the greater the resistance they confer. It is suggested that the use of anti tetanic vaccination which is compulsory in the French Army should be made general. In conclusion Groulier urges that active immunization should be used for the prevention and serum therapy for the treatment of tetanus.

293

Gold Intoxication and Eosinophilia

D L HULST (*Nederl Tijdschr Geneesk* February 27, p 868) who records four illustrative cases in patients aged from 25 to 51 under treatment with solganol for chronic rheumatism maintains that a connexion between gold intoxication and basophil granulation of the red corpuscles has not been proved and is unlikely. Basophil granulation being probably a phenomenon of regeneration. Many cases of gold intoxication are preceded or accompanied by an increase in the number of eosinophils which disappear as the symptoms of intoxication subside. The appearance therefore of eosinophilia during gold treatment is an indication that the injections should be stopped.

294

Cerebro spinal Fluid in Active Syphilis

TEIZO UEDA (*Jap J Derm Urol* December 1936 p 219) found positive serological changes in the cerebro spinal fluid in 19 per cent of cases in the primary in 43 per cent in the secondary and in 32 per cent in the tertiary stage of syphilis. The positive reaction was more pronounced in tertiary syphilis as compared with the first and second stages but was at its highest in syphilis of the central nervous system. The proportion of positive reactions was greater in the papulous forms than in the maculous forms and greater in the recurrent than in the primary exanthemata. The proportion of positive reactions in alopecia syphilitica was smaller than the average for the second stage. Recent cases generally reacted well to treatment. The original Wassermann the Browning, and the Murata reactions were negative in the cerebro-spinal fluid in all cases of primary and secondary and only in one case of tertiary syphilis. The fractional determination of the albumins of the cerebro spinal fluid was carried out by the diaphanometric method and the following results were obtained. (1) there was an increase of the general albumin and of globulin already in primary syphilis. (2) the average quantity of albumin was higher in secondary than in primary syphilis. (3) in tertiary syphilis the increase in the quantity of albumin was more striking than the other serological changes in the cerebro spinal fluid.

You sleep **BETTER** on a Staples

To a man this means health and vigour—to a woman a prettier expression and youth.

The reason is commonsense—your rest is perfect rest—your sleep perfect sleep—because the silken silence and correct support of the Staples Mattress causes every muscle to relax.

To-day everybody knows that "complete relaxation of the muscles causes automatic relaxation of the nerves

"It Pays to Buy the Best.

STAPLES MATTRESS has silken-covered BLUE cables—an exclusive (patented) Staples feature—deliciously soft—absolutely silent—obtainable in no other mattress
STAPLES OVERLAY (of patented construction) has no pockets to burst and no string ties to break—it is covered by 5 Exclusive Patents and is by far the most luxurious overlay ever made—

Staples Mattresses from 43/6 to 90/ Overlays from 7/6 to 28/1 3 ft.

CURTIS ABDOMINAL SUPPORT N°1

Gives Scientific support without Constriction

The anterior posterior pressure of the Curtis Abdominal Support No 1 is recognised as the most satisfactory method of giving support to the lower abdomen without employing undue circumferential pressure. The support is light in weight and scientifically designed to give greater freedom to the hips than any other. It is unhesitatingly prescribed by medical men as the most efficient support for all forms of Abdominal Ptoxis.

SALT'S ^{PATENT} KIDNEY BELT

Gives
firm
support
UNDER
the
kidney

The consistent efficiency of this Belt is largely due to the simplicity of its design. A steel spring on the outer side gives the requisite pressure on an inflated rubber pad on the inner side of the belt. This supporting pressure is applied directly under the kidney preventing that organ from dropping and obviating symptoms due to dragging on the renal ligaments. The belt is described at greater length in SALT'S CORSET AND BELT BOOK. Practitioners are invited to write for a free copy of this useful publication, together with a special pamphlet on the subject of 'Movable Kidney'.

'VARIBAN' ELASTIC BANDAGE PLASTER

VARIBAN' BANDAGE constitutes a marked advance on the older methods of treating chronic ulceration of the leg. It is made from a specially woven selvedge material possessing highly elastic properties and is impregnated with an antiseptic zinc oxide paste.

VARIBAN is self adhesive and combines the principles of firm equable pressure and support to the swollen leg with the benefit of an occlusive dressing under which the ulcer is protected and is stimulated to healthy repair.

In promoting proper circulation VARIBAN steadily reduces oedema. It provides protection to the granulations of the healing ulcer. In the majority of cases it is found that pain is either eliminated or greatly relieved from the first application. The necessity for ointments, lotions, etc. is obviated while VARIBAN provides an ambulatory treatment which allows of full activity of the limbs with better results than those following rest in bed alone.

IN CASES OF CHEST COLD, BRONCHITIS, ASTHMA, WHOOPING COUGH, SPASMODIC CROUP, and similar respiratory affections Vapo Cresolene brings relief. The germicidal vapour clears air passages and soothes paroxysms. Used at night during sleep, it helps the patient to obtain undisturbed rest. Vapo Cresolene is specially prepared from creosoles of coal tar and has a reputation of 57 years standing. It is invaluable for the treatment of children. Laboratory tests by a research laboratory of unquestioned standing show that the vapours produced from Vapo Cresolene by the Cresolene Vapours exert a direct germicidal action when in contact with moist surfaces harbouring pathogenic bacteria associated with respiratory affections.

Mild Constipation shown to yield to laxative effect of HOVIS

Many of the mild forms of constipation so prevalent to-day are attributed to the consumption of foods deficient in Vitamin 'B'. In comparing the effects of various kinds of bread it is seen that HOVIS germ bread is superior to either white bread or wholemeal in supplying this deficiency.

Whilst white bread contains practically no Vitamin 'B', HOVIS, with its added

proportion of 25% wheat-germ, supplies an abundance of this essential food-element. Unlike wholemeal bread, HOVIS contains only a minute percent age of bran and indigestible cellulose. In other words its incorporation in the normal diet ensures not only a higher standard of nutrition but easier assimilation and regular evacuation of the intestinal contents.

VITAMIN 'B' CONTENT ACTS AS AID TO REGULARITY

ECZEMA

Relief and cure with Peat ointment

Because eczema generally brings pain and itching, any local dressing should attempt soothing as well as healing. And this is the great virtue of Sphagnol peat ointment—that from its first touch, it gives coolness and comfort to tender skin.

Many doctors find Sphagnol so successful that they are prompted to write about it. Here is an extract from one of the letters we have received:

"Thank you for the ointment. I have tried it on an incipient case of local eczematous trouble and found it to give great relief and to arrest the manifestation."

Signed (Dr) R. L.

Test Sphagnol personally. On receipt of a postcard we shall be pleased to send you a sufficient supply.

either VOLUNTARY or TEMPORARY PATIENTS
at a weekly fee of TWO GUINEAS and upwards.

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS, NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER CMG ADC.

Medical Superintendent DANIEL I. RAMBAUT M.A. MD

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses male or female in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance, to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra Violet Apparatus and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North West side of the Estate, a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton) who can be seen in London by appointment.

HAYDOCK LODGE, NEWTON-LE-WILLOWS, LANCASHIRE

Tele. Street, Ashton-in-Makerfield. Phone Ashton-in-Makerfield 7311.
For the reception and treatment of PRIVATE PATIENTS of both sexes of the UPPER AND MIDDLE CLASSES suffering from mental and nervous diseases either voluntarily temporarily or under Certificate. Patients are classified in separate buildings according to their mental condition.

Situated in park and grounds of 400 acres. Self supported by its own farm and gardens in which patients are encouraged to occupy themselves. Every facility for indoor and outdoor recreation. For terms prospectus etc. apply MEDICAL SUPERINTENDENT.

COURT HALL, KENTON, near EXETER,

for the treatment of eight Ladies, voluntary, temporary, or certified patients.

OVER SEVEN THOUSAND POUNDS

worth of new equipment, furniture, service re-organisation have gone into

The CLINIC

during the past 12 months

YET CHARGES REMAIN THE SAME

TO DAY The CLINIC, the wonderful Nursing Home in Devonshire Place, W 1, might have been richer by over seven thousand pounds compared with a year ago—to such an extent have the public and the Medical Profession responded to its offer of the finest possible Nursing Home Service

Yet actually it is the Public and the Medical Profession who are the richer—for the whole of that sum (more than £7,000) has, true to the principles embodied in the Constitution of the operating Company been put back into The Clinic and spent on renewals and improvement of equipment and services, and thus without any increase of charges to the public

A large portion of the money was spent in a thorough re-organisation of the nursing and catering services previously at a remarkably high standard. As to catering at The Clinic now "It seems nowadays you have to be ill" wrote a patient there recently, "to learn how to live really well"

While the average charge for a room at The Clinic remains at fourteen guineas charges actually range as before, from 10 to 18 guineas, while there are a few suites at 25 to 42 guineas. All these rates include a free dispensary service—an "extra" which cost The Clinic nearly £2,000 last year. Enquiries and visits from the medical profession are welcome, and the Secretary will be glad to furnish further details

BRITISH ASSOCIATION OF RADIOLOGISTS (FELLOWSHIP BOARD)

FELLOWSHIP EXAMINATION

The first Examination for the Fellowship of the Association will be held in London during the period November 29th to December 3rd.

The Examination is limited to Medical Practitioners who are duly registered in the country in which they practice and who hold a recognised Diploma in Radiology. The Diplomas so far recognised are those granted by the following bodies: The Universities of Cambridge, Edinburgh, Liverpool and London, the Conjoint Board of the Royal College of Physicians of London and the Royal College of Surgeons of England and the American Board of Radiology.

The principal subjects of the Examination are
I RADIODIAGNOSIS
II RADIOTHERAPEUTICS

All candidates must present themselves for examination in both subjects and will be required to pass in one of them on an honours standard. They will also be examined in general medicine, general surgery and general pathology but those who have passed examinations for higher medical or surgical qualifications may be exempted partly or wholly from this part of the Fellowship Examination. A thesis for published work in lieu of a thesis concerned with some aspect of their honours subject is also required from candidates and must be presented before the end of August. As regards overseas candidates theses arriving in London up to the end of October will be considered.

In addition to passing the Examination candidates must comply with the conditions for ordinary membership of the Association before they can be elected Fellows. Practitioners intending to specialise in Radiology are however invited to register their names with the Board in order that they may receive information.

Further particulars may be obtained from

REVISED TERMS ON APPLICATION

Numol & Irradiation

A radiology specialist has told us of a case under his care in which a boy (suffering from Rickets and a badly curved spine) had been treated for more than three years, the greater part of the time without any definite improvement, but with fair rather than full results from ultra-violet ray, and baths. The doctor eventually decided to include a course of NUMOL in the treatment and, from that time, steady and certain progress was experienced, and the boy's weight increased from 5 stone 10 lbs to 6 stone 7 lbs in a few weeks.

We have heard of many cases where patients taking a course of ultra-violet rays were given NUMOL as a supplementary treatment with complete success.

Doctors who have not already
had a sample of NUMOL are
invited to write for one to the
undersigned address

NUMOL

THE FOOD OF HEALTH

★ In all cases of debility and malnutrition, whether of long standing as in the case quoted, or during convalescence from a recent illness, NUMOL is invaluable in building up body weight and tone. Being very easily assimilated it imposes no strain on the weakened digestion. It is also extremely palatable and therefore of special advantage in the treatment of young children.

BELLERGAL

THE REGULATOR OF AUTONOMIC FUNCTION

"In the treatment of autonomic dystonia it is necessary to consider the simultaneous influence of an associated sympathetic and vagus excitation. Rothlin has shown that a combination of Bellafoline and Femergin is well suited as a sedative of the autonomic nervous system, particularly as regards peripheral hypertonicity. The addition of phenobarbital, a sedative of the central nervous system, to this combination gives the preparation known as Bellergal which is now established as the remedy of choice for the treatment of autonomic dystonia."

WILLIAMS' OBSTETRICSRevised by H J STANDER, M.D.
from the text of J Whitridge Williams, M.D.

It is fortunate that the publishers were able to secure the services of Dr H J Stander to bring out the seventh edition, for of all men he is the most likely to safeguard the traditions of his teacher's masterpiece. There is no need to recommend a book so well known. It possesses a breadth of vision and almost Olympian attitude towards the subject, that places it above the arena of controversy. In spite of its great erudition it indicates a practical conservative and dependable line of treatment for every obstetric emergency. WILLIAMS' OBSTETRICS has been by common consent, for many years the outstanding book on the subject in the English language, and it would be difficult to find its equal in any language. —*British Medical Journal*

Ready Shortly**A TEXT BOOK OF DIAGNOSTIC ROENTGENOLOGY**

LEWIS J FRIEDMAN, M.D.

In this new book Dr Friedman supplies the long needed complete treatise on roentgenology. He gives a thorough and complete analysis of all aspects of the subject, beginning with the consideration of the theoretical and material phases of the X ray machine and then continuing with a well rounded discussion of techniques and their rationales, a discussion of X ray physics and its practical application, descriptions of all diagnostic problems and the considerations of the aetiology, pathological changes and roentgenographic descriptions of the various diseases.

LEGAL MEDICINE AND TOXICOLOGY

T A GONZALES M.D.

MORGAN VANCE, M.D., and MILTON HELPERN, M.D.

With an Introduction by Harrison S Martland, M.D.

A thoroughly modern consideration of legal medicine with an equally up to-date exposition of toxicology. Particularly noteworthy are the chapters on the special technical processes used in medico-legal investigations such as examinations of blood and iso agglutination tests. Throughout the subject has been treated from the viewpoint of the physician in practice. Material outside of his sphere has been eliminated or simply sketched in for unity and coherence. By no means the least remarkable features of this volume are the illustrations they cover the subject with unequalled scope and a technical excellence that contribute greatly to the usefulness of the volume.

CARBON DIOXIDE IN GENERAL PRACTICE

To the Editor of THE LANCET

Sir—During one single hour of general practice last week the value of carbon-dioxide resuscitation was very strongly brought home to me by three events (1) a mother with respiratory failure under chloroform during an instrumental labour (2) the child which required artificial respiration before it breathed (3) as soon as I had returned to my house a road accident in which a youth received serious multiple injuries through contact with a motor vehicle. When I arrived on the scene he was unconscious almost pulseless and his breathing nearly imperceptible. I applied a diluted carbon-dioxide-air mixture under a facepiece for a few moments while I examined him. His breathing and pulse improved and he was fully conscious when he was loaded into the ambulance although his injuries included broken ribs a fractured shoulder and a leg which was crushed from the thigh to the ankle. I feel confident that many of our road fatalities are due to respiratory failure within the first few moments after the accident which carbon dioxide made available by a portable supply might do much to prevent.

I am Sir yours faithfully

83½% of Edinburgh Doctors
prefer a mild cigarette!*

"Beyond any doubt the doctors must be right in preferring mild cigarettes. It's silly for me to point out how important a singer's throat is to him. I naturally safeguard mine in every possible way—and one way is by smoking nothing but Kensitas, for I know their mild flavour will never harm my voice."

Joseph Hislop

MR. JOSEPH HISLOP the
famous tenor opera star

In a recent independent survey, an overwhelming majority of lawyers, doctors, lecturers, scientists, etc., who said they smoked cigarettes, expressed their personal preference for a mild cigarette.

Mr Hislop verifies the wisdom of this preference and so do other leading artists of radio, stage, screen and opera, whose voices are their fortunes, and who choose KENSITAS, a mild cigarette. You, too, can have the throat protection of KENSITAS—a mild cigarette, free of certain harsh irritants removed by the exclusive KENSITAS Private Process.

* 83½% of Edinburgh doctors, who smoke cigarettes, as shown by replies to a strictly independent survey, prefer a mild cigarette.

Vineyard Grape Juice IN SICKNESS AND IN HEALTH

The therapeutic value of fresh Vineyard Grapes has been so long recognised for all maladies whose prime cause is malnutrition, that little need be said of it here. We would mention, however, that our previous announcements concerned with anaemic conditions have met with generous medical approval. Grape Juice

as an early morning drink is quite as applicable to those enjoying good health. Rich in valuable vitamins and energising elements, VITA is just the pure juice of Vineyard Grapes, non-alcoholic and highly concentrated. A tablespoonful diluted with water gives economical, healthy refreshment.

A sample bottle is available to the practitioner free on request.

A Menstrual Regulator . . .

When the periods are irregular, due to constitutional causes, ERGOAPIOL (Smith) is a reliable prescription. Containing apiol (MHS special) together with ergot, aloin and oil of saffron of the highest quality, this preparation effectively stimulates uterine tone and controls menstrual and postpartum bleeding.

In cases of Amenorrhoea, Dysmenorrhoea, Menorrhagia and Metrorrhagia, Ergoapiol serves

as a good uterine tonic and hemostatic. Valuable in obstetrics after delivery of the child and for the menstrual irregularity of the Menopause.

Prescribe 1 to 2 capsules 3 or 4 times daily. Supplied only in packages of 20 capsules. Literature on request.

As a safeguard against imposition the letters MHS are embossed on the inner surface of each capsule and only when the capsule is cut in half as shown.

The ideal blood builder in pregnancy ★

The growing foetus often induces hypochromic anaemia in the pregnant woman, which must be combated with iron in such form as her sensitive stomach and nerves will readily tolerate. Ovoiderrin, the blood-builder, meets this requirement admirably because it is odourless and practically tasteless. It does not affect the teeth and does not constipate. It often induces

intestinal peristalsis. Years of highly satisfactory clinical results have served to classify Ovoiderrin as the "ideal haematinic."

Each adult dose of Ovoiderrin contains one grain of metallic iron held in colloidal form by a protective protein colloid. Ovoiderrin is equally effective in children in proportionate dosage.

The importance of The Qualitative Adequacy of the Diet

If the diet is unsuitable the body cannot be properly constructed neither can it function effectively

(Ministry of Health First Report of Advisory
Committee on Nutrition 1937 p. 6)

The report quoted above stresses the need for ensuring that the whole community is provided with food which is qualitatively adequate. And it is acknowledged that food-stuffs containing vitamins play an important role in the economy of the body. Marmite is a yeast extract

that is exceptionally rich in vitamin B₁ and the B₂ complex. It is prescribed extensively for its positive health promoting properties. Marmite has many uses in preventive and curative medicine and there is ample evidence of the benefit accruing from its regular inclusion in the diet.

ANAHÆMIN B.D.H.

In the treatment of pernicious anaemia

It is continually being demonstrated in the ordinary routine of clinical practice that average cases of pernicious anaemia respond to an initial injection of 2 c.c. of Anahæmin B.D.H., followed by 1 c.c. injections at 10 day intervals until the blood count has remained normal for a month, whilst for the maintenance of the patient in a condition of robust

health a monthly injection of 2 c.c. is usually sufficient in most cases.

Furthermore, not only is anahæmin treatment remarkably effective, but the cost of anahæmin therapy is exceptionally low, inasmuch as six injections, at a total cost for material to the physician of not more than 25s. or even less, suffice usually to re-establish a normal blood count within six to eight weeks.

WHOOPING COUGH

Detoxicated Whooping Cough Vaccine (Genatosan) has proved remarkably successful. Reports received from medical practitioners state that it usually reduces the frequency of the paroxysms after the first injection, and subsequent injections almost invariably clear up the condition. Owing to the elimination of the toxic elements of the germ during the process of manufacture, this vaccine may be given to infants and young children, in doses sufficiently large to produce the desired therapeutic effect, with an absence of harmful reaction.

The following is typical of many reports received from physicians —

"I have been making a somewhat extensive use of your Detoxicated Vaccine for Whooping Cough, and am pleased to say that the results have been almost invariably gratifying. In nearly all my cases the very distressing symptoms have disappeared after the third injection." — M D

Additional information regarding this Vaccine will gladly be supplied on request

CHARTS CANNOT EXPLAIN IT

Alka-Zane is an effervescent salt of the carbonates, phosphates and citrates of sodium, potassium, calcium and magnesium. It is free from lactates, sulphates and tartrates, and sodium chloride. A teaspoonful in a glass of water makes a zesty, refreshing drink.

Alka-Zane is supplied in bottles containing 4 ounces. The dose is one teaspoonful in a glass of water.

IT takes personal observation in practice to evaluate properly the good effects of Alka-Zane in systemic acidosis—threatened or actually present.

The clinical thermometer will show how fever abates when Alka-Zane is an adjunct of the treatment in influenza and other febrile diseases.

The pregnant woman will curtail her story of uneasiness and discomfort, when Alka-Zane is administered during the puerperium.

Certain skin diseases will show a marked tendency to improve when Alka-Zane supplements the treatment. Albumin will diminish in the urine when Alka-Zane is given in nephritis.

These are just a few examples where Alka-Zane may prove of evident usefulness in the treatment of diseases in which acidosis is a complicating factor.

PROGESTIN B.D.H.

In the treatment of dysmenorrhœa, menorrhagia and abortion

A deficiency of the corpus luteum hormone (progestin) results in a prolongation of the proliferative phase of the uterus and further in undue contractility of the uterine musculature.

Menorrhagia and possibly sterility are often the outcome of prolongation of the proliferative phase whilst dysmenorrhœa and (in pregnancy) a tendency to abort results from the spasmodic contractions of the uterus.

The use of Progestin B.D.H. is indicated, therefore in the treatment of menorrhagia, sterility, dysmenorrhœa and abortion.

In appropriate cases it is often an advantage to augment the treatment by giving Gonon the gonad stimulating substance, or Oestroform the hormone of the ovarian follicles.

Ho 52

ALASIL

Safe Salicylate Therapy

THE popularity of acetyl salicylic acid is undoubtedly due to the fact that it is one of the safest and most effective non narcotic analgesics available. Too often however, its use has been discarded by the physician on account of its tendency to irritate the stomach and because entirely pure preparations are not always available.

Alasil provides the beneficial therapeutic effects of pure acetyl-salicylic acid in such a form that it is acceptable even by disordered digestions. This tolerability is due to the fact that it combines calcium acetyl salicylate—the least irritating salicylate compound—with Alocol a potent gastric sedative and antacid.

Since Alasil™ is better tolerated than acetyl salicylic acid its use can be pushed or prolonged to a much greater extent than the latter. Alasil is therefore, an analgesic antipyretic, and antirheumatic which can be employed with complete confidence in all the many conditions in which such an agent is indicated.

"ALOCOL"

Colloidal Hydroxide of Aluminum

For Gastric or Duodenal Ulcer

IN view of the increasing adoption of intensive alkaline medication for gastric and duodenal ulceration the selection of a suitable antacid agent is a matter of considerable importance to the general practitioner.

Alocol allows of antacid therapy in a particularly effective safe and reliable form and replaces with advantage mixtures composed of sodium bicarbonate, magnesia, bismuth, etc. It does not determine any unpleasant secondary reactions even when taken in strong doses and over a long period of time.

The powerful antacid effect of Alocol is more mechanical than chemical in nature. It acts by adsorbing excess of hydrochloric acid thus facilitating its elimination. It promptly relieves pain and being non absorbable is free from toxic sequelae.

See the chemical history of Alocol with convincing clinical reports and supply for trial sent free to physicians on request

Constipation

In spite of dietetic measures and exercise many patients still suffer from the devitalising effects consequent upon intestinal stasis. To such, the attainment of perfect health is debarred. Whether in disease or convalescence faecal stagnation & retards recovery.

In health and in the majority of pathological conditions, an efficient and safe aperient will be found in Andrews Liver Salt. It is a briskly effervescent Saline with a pleasant taste.

Antacid in action, it stimulates the secretion of bile and of the mucus glands of the intestines, and causes a semi-fluid stool and a painless, easy evacuation.

Especially indicated in the constipation of childhood and old age; of inestimable value to those who travel; and a valuable adjunct in the treatment of those conditions incident to hepatic congestion and torpidity.

An 8-oz Tin will be sent free, on request, to any member of the Medical Profession.

Andrews Liver Salt

Scott & Turner Ltd., Gallowgate, Newcastle-on Tyne.

Cystopurin

The ideal urinary antiseptic for oral administration!

- | | |
|--|---|
| 1 Produces no gastric irritation or toxic symptoms | 5 Acts from the renal pelvis downwards |
| 2 Is readily absorbed from the gut and excreted in the urine | 6 Is active in either acid or alkaline urine |
| 3 Causes no renal irritation | 7 Perfectly safe for use in febrile conditions |
| 4 Renders the urine bactericidal in low concentrations | 8 Acts on all causative organisms of urinary infections |

PYELITIS

From information received —

"I am glad to inform you that I obtained very encouraging results from Cystopurin in a case of pyelitis of five years' duration. The discharge has greatly decreased and the mild pain of which the patient was complaining entirely subsided after five days' course of treatment."

"I have used Cystopurin in a case of acute pyelitis in a child of 3 with good results. The child could not take Milt Pot. Cit., but was managed to get crushed tablets down in glucose solution."

"I tried Cystopurin on a case of pyelitis in a girl of 24. The urine was loaded with pus and there was enuresis and typical swinging chart of septic-type ranging to 103°."

"At first on a dose of one tablet three times a day there was no change. After 3—4 days I increased to 2 tablets 3 times a day. Fever disappeared and the enuresis improved at once but persisted until yesterday no pus seen on sedimentation (standing over night) for the first time and is a great improvement now."

"This case (pyelitis) operated in Hospital and one kidney removed. When she was able to come back to the surgery the urine was found to be loaded with albumen and pus. After 10 days' treatment (Cystopurin) had no pus present only slight trace albumen. This cleared up after another week's treatment."

Supplied in bulk and in tubes of 20 tablets for dispensing purposes.

A purified fraction of
liver extract possessing
remarkable hæmopoietic properties

NEO-HEPATEX

(PARENTERAL)

For intramuscular or intravenous use

Neo-Hepatex (parenteral) is the result of an original process designed to conserve the maximum amount of the active hæmopoietic fraction of liver and is prepared under the supervision of a staff of biologists with ten years' experience in research work on liver extracts

In addition, each batch is clinically tested in hospital. This ensures the high and consistent clinical activity which has made Neo-Hepatex an accepted standard in parenteral liver therapy the world over. A copy of the relative clinical test chart is enclosed in each box.

Neo-Hepatex may be administered in any dosage demanded by the condition of the patient, its clinical potency enabling the clinician to give a more than adequate dosage in small volume.

Neo-Hepatex is issued in Ampoules

Doses of 6 x 1 cc - 5/- 6 x 2 cc - 7/6 3 x 4 cc - 6/6

The high potency of Neo-Hepatex renders it most economical in cost

THYROID-OVARIAN EMPLETS

IN many disorders associated with deficiency of the ovarian hormone there is also a definite tendency to hypo-thyroidism as is shown by the gradual decrease of ovarian activity at the menopause, which is accompanied by a decrease in thyroid activity manifest by a decreased metabolic rate with consequent obesity

¶ *Thyroid-Ovarian Emplets* are indicated in conditions associated with hypo-thyroidism and deficiency of the ovarian secretion, including sexual infantilism, menstrual disorders, frigidity and vasomotor disturbances of the artificial and natural menopause, particularly when there is a tendency to obesity

¶ *Thyroid-Ovarian Emplets* are compressed tablets containing a combination of ovarian substance gr $\bar{5}$, with desiccated thyroid gland gr $\frac{1}{4}$ the tablet being coated with a special acid-resisting mixture, the special coating protects the gland substances from possible inactivation by the acid gastric secretion, but allows easy disintegration in the alkaline secretion of the small intestine. The dose is one Emplet, swallowed whole

I Further particulars of the above and other Emplets in the series will be forwarded on request **I**

concentrate

MADE IN ENGLAND

'Zephiran' Concentrate is a substance built up on an entirely new chemical basis. Containing neither phenols nor the salts of the heavy metals, it is free from their disadvantages, but very superior to them in its bactericidal power.

'Zephiran' Concentrate is practically odourless and very economical in use. A 1/2000 solution will kill the haemolytic streptococcus in 2½ minutes. For all surgical and gynaecological work, sterilisation of the hands, etc. Bottle (6 oz) 3/3.

PHARMACEUTICAL SPECIALITIES
(MAY & BAKER) LTD., DAGENHAM

Heat Sterilized without loss of flexibility

Surgical Catgut is manufactured from the submucous cellular coat of the sheep's intestine

This material is converted into gelatin by the action of heat in the presence of moisture

Heat sterilization is carried out therefore, after complete dehydration of the catgut. After sterilization, the tubes of catgut are filled with a 96% alcoholic solution, the 4% aqueous content imparting flexibility to the suture

This variety of catgut, as taken from the tube, has the correct degree of flexibility and tensile strength. The suture requires no conditioning before use.

The entire product manufactured in England.

Descriptive booklet will be sent on application.

TOP—Removal of the mucous coat by mechanical means, before decomposition commences.

BOTTOM—Hermetically sealing glass tubes containing a crude catgut.

ADEXOLIN LIQUID AND CAPSULES

Standardised concentrates of vitamins A and D. One capsule recommended daily as a general protective tonic and nutritional barrier to seasonal infections. In pregnancy one daily for the last 100 days. For infants 2 drops in every bottle feed. Each 3m capsule equivalent to 10 cc and each cc of liquid equivalent to 20 cc of medicinal cod liver oil. Capsules: boxes of 25 2/9 100 8/6 500 33/6 1 000 56/ Liquid 4-oz. phial 2/6 2-oz. bottles 7/6 4-oz. 12/6 8-oz. 22/6

SYRUP MINADEX

The reconstructive two-in-one tonic containing the active principles of *Syr Ferri Lorthoph Co* and vitamin A and D incorporated as concentrates free from oil (18 000 and 3 000 international units per fl. oz. respectively). Restores appetite and tone to debilitated patients particularly those convalescing after acute illness. Combats anaemia, raises resistance to infection. Children thoroughly enjoy its appetising flavour. 6-oz. bottles 2/6 80-oz. winchesters 7/6.

DISSOLVED VACCINES G.L.

The high standard and rapidity of the effects produced by Dissolved Vaccines G.L. are due to two factors: first that the organisms being in solution can stimulate the antigenic response immediately upon injection; secondly that being detoxicated the vaccines can be given in sufficient and substantial dosage without provoking undesirable reactions. In 5 cc rubber capped bottles 7/6 10 cc 10/9 25 cc 17/6 (Whooping Cough Dissolved Vaccine G.L. 5 cc bottles 10/9 10 cc 15/6 25 cc 25/6).

FERSOLATE

(FERROUS SULPHATE TABLETS G.L.)

For all iron deficiency anaemias. Convenient highly effective inexpensive. Each 3 gr tablet contains encapsulated ferrous sulphate yielding exactly 1 gr ferrous iron the most effective agent for treatment and is therapeutically equivalent to 13 grs Maudsli's Iron B.I. Dosage can therefore be achieved in minimum bulk. Bottles of 100 2/6 tins of 500 7/6 1 000 12/6

THE RESULTS OF HIGH ATROPINE DOSAGE IN CHRONIC EPIDEMIC ENCEPHALITIS, WITH COMMENTS

by

ARTHUR J. HALL, M.A., M.D., D.Sc., F.R.C.P.

*Emeritus Professor of Medicine University of Sheffield Consulting Physician Sheffield Royal Hospital
Visiting Physician South Yorks Mental Hospital and State Institution Rampton*

In the article on treatment of the post-encephalitic Parkinsonian which appeared in this *Journal* on September 21 1935 reference was made to a series of cases then undergoing treatment by high atropine dosage. Since then more cases have been treated and it has been possible to follow them up long enough to warrant certain conclusions as to its value.

For the large amount of time and trouble in carrying out the treatment and keeping records my sincere thanks are offered to many colleagues both at public institutions and in private practice including amongst others Dr Bamford medical superintendent Gateshead Mental Hospital Dr Pool and his staff at the South Yorkshire Mental Hospital Dr Schneider and his staff at Rampton State Institution Dr E. Fretsen Skinner at the Sheffield Royal Hospital and Professor E. J. Wayne at the Sheffield Royal Infirmary. To Professor Wayne I am particularly indebted not only for the great trouble and interest he has taken in the cases which he has had under observation in his wards from my clinic but also for his criticism and advice in the preparation of this paper. My part has thus been only that of a collector. At the same time any opinions, views or conclusions which follow are mine and I alone take responsibility for them. It has for long been known that atropine in the form of belladonna, stramonium or hyoscyamine may relieve the physical disability in some cases of chronic epidemic encephalitis and that for this purpose doses rather larger than those laid down in the *British Pharmacopoeia* are often required. Bremer (1925) called attention to the fact that Parkinsonians showed unusual tolerance to this alkaloid so that as much as 20 mg. a day had been given per os without the occurrence of toxic symptoms. The method known as high atropine dosage introduced by Kleemann (1929) is based upon Bremer's observations. Since then the method has been widely adopted. It is not necessary to go into full details of this method which can be found in the article already referred to (Hall 1935) but some general indications will be given as to certain modifications which have been found useful.

Estimation of Optimal Dose

Kleemann (1929) begins with 0.5 mg. of atropine daily in the form of 1-2 per cent. solution of atropine sulphate given in two doses. (One drop contains 0.25 mg.) This is increased by 0.5 mg. daily spread over three doses so long as any objective or subjective improvement is produced (maximal dose). When this point is reached reduction should be gradual in order to fix the optimal dose on which improvement is maintained.

In many of the cases in this series this method has been followed. In some however after an initial small dose has been tolerated a greater daily increase has been made without ill effects. Indeed in patients who have previously been for some time on tincture of belladonna one may give 5 or even 10 mg. of atropine on the first day and increase by 2.5 mg. daily not only without ill effects but in suitable cases with rapid benefit.

Earlier observers have emphasized the necessity of keeping the patient in bed whilst estimating the optimal dose. In our experience unless already bed ridden complete rest is neither necessary nor desirable after the first day or two of treatment. Even those bed ridden at the onset should be encouraged to get up as soon as they show signs of improvement. Close daily observation of the patient is essential so long as the dosage is being increased.

In Kleemann's cases the usual optimal dose was 3 to 7 mg. atropine daily. In this series the average optimal dose was about 18.5 mg. atropine daily. The highest was 54 mg.—with definite improvement. Maximal and optimal doses however are not fixed points on a measurable standard but largely dependent on two variables the patient and the physician. In many cases indeed they are very difficult to assess. At any rate the fact that 54 mg. of atropine per day can be tolerated not only without harm but with benefit shows that even the less bold prescribers need not apprehend serious danger when estimating the maximal dose. Reference will be made later to such unpleasant effects as may arise and how they may best be met.

One further point as regards the continuation of treatment after the optimal dose has been found. We have found it a convenience to prescribe the atropine in coloured tablets. Pink tablets contain 4 mg. atropine, yellow only 1 mg. By this combination of strengths it is easy to obtain any required dose of 1 mg. or upwards. The patient has no difficulty in knowing exactly how many of each colour he has to take for a dose and this coloration distinguishes them from other less potent tablets.

Van der Meulen (1933) and others have emphasized various dangers which may occur on a sudden omission of a dose in the course of treatment. So far as this series is concerned no such dangers have occurred for some time without any untoward results.

Published Records

The records of high atropine treatment published from time to time by different observers do not widely differ in the results obtained. At one extreme the dose which has been

[1937]

high percentages of complete or almost complete recoveries, at the other those in which the results have been disappointingly slight and fugitive. The greater number of records published by those who have given the method an adequate trial show results somewhere between these two extremes. They agree that in certain cases the results are extremely good, in others there is definite improvement, whilst in still others benefit is slight or absent.

In analysing the following series of cases an attempt will be made to suggest some data whereby it may be possible before advising this somewhat severe line of treatment to foretell which cases are likely to benefit and which are not.

To do this it is necessary to have some method of dividing the cases into groups. This is difficult, because the virus of encephalitis, although having a predilection for certain levels, may attack almost any part of the nervous system and in so doing may affect some one or other part only, or several parts together to an equal or unequal extent. It may thus give rise to two broad classes of disability, which, although necessarily closely intermixed in effects, may be termed 'psychotic' and 'physical' respectively.

Classification of Physical Disabilities

A simple basis for classifying physical disability in Parkinsonism is one suggested by me in 1934—namely the extent to which it interferes with the three acts of everyday life which mark the limit between dependence and independence. These are feeding, dressing and moving about. The three classes of physical disability would then be:

1. Complete independence
2. Partial dependence
3. Complete dependence

In Class 1 may be placed those who can feed and dress themselves and walk about without assistance. They may be very slow at their meals, there may be some shakiness. They may have oculogyric attacks or torsion spasms. Their gait may be abnormal, they may even fall over at times, but they do not require physical assistance. They can look after themselves.

Class 3 is also clearly defined. They can neither feed nor dress themselves, they cannot walk without help, indeed in some cases they cannot even turn over to change their position in bed, but have to call for help in order to do so.

Class 2 necessarily includes persons who differ widely in the amount of their physical disability. Some can walk without help but cannot feed themselves on account of tremor. Others can feed and dress themselves but cannot walk without help and so forth. In other words some are almost independent, others largely dependent.

These three classes of physical disability are not necessarily consecutive. Although the tendency is for the Parkinsonian to become gradually more helpless as time goes on, yet this is not always so. There are cases which remain in Class 1 year after year and show no tendency to get worse, others who quit early in their illness were in Class 3 but owing to treatment of various kinds have returned to, and remain for years in Class 1 or Class 2.

Classification of Psychotic Disability

To classify psychotic disability is more difficult. The forms in which it may show itself are too numerous and too complex to serve as a basis. For practical purposes

however, it is convenient to make two groups according to the extent to which it dominates the clinical picture. Thus into Group A are placed those in whom psychotic disability may be said to be 'primary or predominant' and into Group B those in whom it is "secondary, or so slight as to be negligible". This or any such arbitrary grouping is necessarily very imperfect. Usually however, there is little or no difficulty in deciding to which group a particular case belongs.

In most of the cases under certificates the predominance of psychotic disability is obvious. On the other hand in a certain small number of certified patients, especially those in whom 'physical disability' is advanced, the 'psychotic disability' has either always been secondary to the physical disability or though originally predominant has become less so with the increase of the latter.

By combining the degree of psychotic and physical disability present in each case it is possible to classify the encephalitics in the following way:

Psychotic Disability		Physical Disability	
Group A	Marked	(1) Independent	
		(2) Partially dependent	
		(3) Wholly dependent	
Group B	Slight or absent	(1) Independent	
	"	(2) Partially dependent	
		(3) Wholly dependent	

In the fifty-eight cases here recorded this form of classification has been adopted, and, as will be seen from the results, the benefits obtained from large doses of atropine have been very different in the different groups.

TABLE I—Fifty-eight Cases of Chronic Epidemic Encephalitis Grouped According to their Disabilities

Psychotic Disability	Physical Disability	No. of Cases
Group A Marked	(1) Independent	26
	(2) Partly dependent	8
	(3) Wholly dependent	10
Group B Slight or absent	(1) Independent	4
	(2) Partly dependent	2
	(3) Wholly dependent	8
		14
		58

The larger number of cases in Group A is due to the fact that opportunities for carrying out observations such as these necessarily offer themselves more readily at mental hospitals where there are many such cases and the requisite control is possible.

The results are given in three categories—namely:

- (a) Great improvement
- (b) Definite improvement
- (c) Slight or no improvement.

TABLE II

Classification		Improvement		
	No. of Cases	Great	Definite	Slight or None
Group A (1)	26	0	5	21
" (2)	8	0	2	6
" (3)	10	2	2	6
Total	44	2	9	33
Group B (1)	4	0	3	1
" (2)	2	1	1	0
" (3)	8	6	2	0
Total	14	7	6	1

Cases Greatly Improved

It is seen that in nine cases (three men and six women) the improvement is described as great. Such a term hardly does justice to the facts, it might well be called 'extreme'.

In each of these cases the person, who had been practically bed ridden and required help in almost every act of daily life for a long period (in some cases years) was as the result of treatment, not only able to be up and about but also to take part in and enjoy social life again. The following is a short account of four of these cases.

Case 41 Female aged 49—Acute attack in 1919. In 1921 Parkinsonism developed with stiffness and tremor of the right arm and leg. There was never any excessive salivation. Mental symptoms took the form of a somewhat childish emotional psychasthenia. In 1925 treatment by belladonna was begun and 20 minims of the tincture was taken three times a day. On this she improved very considerably. Exactly for how long or how regularly this treatment was continued is not recorded but the history of the next few years shows that it was not continued regularly and the doses were diminished. In 1933 there was considerable mental depression. The Parkinsonism was much more marked. She was unable to walk by herself although not actually bed ridden. She was unable to write even her own name on account of the continuous tremors. At that time she was taking 10 minims of tincture of stramonium three times a day. High atropine dosage was begun in July 1935. In August she was taking 13 mg. of atropine per day and the improvement was very great. The tremor in the legs had largely disappeared and was so much less in the right hand that she was able to write a letter without any recognizable tremor in the handwriting. More than a year later in January 1937 she can walk a mile without difficulty, play on the piano again and sew and knit. She has lost her mental depression and is brighter and happier than she has been for many years. The daily dose of atropine is 10 mg. given in four equal doses.

Case 54 Female aged 29—Bed ridden for four years unable to feed herself or to walk without assistance. Speech almost inarticulate. Marked hypertonus. Optimal dose of atropine 30 mg. per day. Condition after four months treatment: she is up and about, can feed and dress herself, takes part in domestic work, goes out for long walks and dances.

Case 57 Female aged 41—Acute encephalitis in 1921 followed by Parkinsonism. During the last few years she has been completely dependent, requiring to be fed, dressed and helped to walk only a few steps. In March 1936 high atropine treatment was begun. The optimal dose was 42 mg. The following is an extract from a letter written early in 1937 by the patient herself—that is about a year after treatment was begun. The handwriting does not show any trace of Parkinsonism. 'I could not walk a hundred yards without holding someone's arm and could not feed myself or help myself in any way. Now I can walk three miles quite alone, feed myself perfectly, take off my own coat etc. I am so much better that I hardly know myself.'

Case 52 Male aged 60—Bed ridden for five years, had to have help in feeding and walking. Speech almost unintelligible. Salivation excessive and continuous. Severe tremor of both arms and legs. Optimal dose of atropine 30 mg. a day. Condition after four months treatment: up and about every day, looks after himself, helps in housework, goes to parties and entertainment. Takes a pride in his appearance. Tremor much less.

At least eight a record of 'great improvement' in only nine out of fifty-eight cases does not seem to compare favorably with some of the results published elsewhere. However, it is realized that in this series there were only seven whose physical disability had reached Class 3, the percentage of 'great improvement' among these is not so considerable.

In Table II it will be noticed that of these nine cases of 'great improvement' seven belonged to Group B—but it is their psychotic disability was no predominant whilst their physical disability before treatment was Class 2 or Class 3.

Unless the physical disability is considerable before treatment is begun it can hardly be said to improve greatly. All such striking and dramatic improvements as have been from time to time recorded must have been Parkinsonians of Class 3 or the more dependent cases of Class 2 such as Case 41 of this series who had to be placed in Class 2 because she was not completely dependent yet her dependence on others before treatment was almost complete and her improvement could only be described as great.

But if atropine is so effective in relieving serious physical disability (Class 3) why did it fail in six cases in Group A (3)? In four of them (Cases 6, 22, 34 and 38) the answer is easy. Long standing Parkinsonism had in each of them led to deformities of the arms, legs and trunk of such an advanced kind that a return to useful conditions was impossible. In the remaining two cases (Nos. 16 and 31) there was no such deformity. In them the lack of improvement was due to the predominant psychotic disability. Both were very impulsive. Neither of them would co-operate. In this connexion a word must be said about Case 42, one of the B (3) group whose improvement was not so great as expected.

This girl had been leading the life of a complete invalid for some years at the home and under the care of a devoted relative who had done everything for her. She was very emotional and would not co-operate in anything that required effort on her part. She had become so accustomed to invalidism and the daily routine of doing nothing whatever to help herself that she would rather remain *in statu quo* than undergo any treatment which involved the least personal discomfort.

Indeed this question of lack of co-operation is by no means uncommon in Parkinsonians of Class B (3) in whom there is a considerable psychotic element.

In fairness to the method, however, it must be admitted that in most of these there was some slight improvement thus the records state:

Case 6—Speech a little better, saliva a little less, can move about in bed a little more easily.

Case 38—Able to help himself a little in feeding. Speech rather clearer.

Case 22—Oculogyric attacks have ceased since treatment.

Case 42—Rigidity and tremor rather less, speech more intelligible.

As regards the thirty-four patients in whom psychotic disability was marked (Group A) and physical disability less (1) and (2) great improvement is not recorded in any and even improvement which could be called definite in a small number only.

These results are in general agreement with those obtained by other observers. It is the general experience that the mental condition of these patients except in so far as it is secondary to the distressing physical disability is not improved to any extent by atropine treatment.

Psychotic disabilities however vary so widely in character that it is impossible to generalize. Brierley (1932) in a report on 130 cases thinks that it has a definite effect on impulsive disorders but no effect on hypomania or psychomotor cases. He finds that it may relieve some symptoms by diminishing motor impulsion. Brierley (1932) finds that it has no beneficial effect on character change. In the mental department secondary to the physical disability.

ability, however, improvement is often marked, as is shown above in the letter written by Case 57. Indeed, to return from complete helplessness to ordinary life sometimes produces a condition of euphoria.

Special Symptoms

Salivation—This is the one condition that should always benefit from full doses of atropine, and indeed even when troublesome will often improve on much smaller doses of atropine such as are contained in the B.P. doses of tincture of belladonna. It is, however, by no means a constant symptom. It may be completely absent, even in advanced cases, whilst in others much less advanced it is a serious source of annoyance.

Oculogyric Attacks—These were present in twenty two of the cases. In five there was no improvement. In twelve the attacks were less frequent after treatment. In five it is recorded that they had ceased entirely. There seems no doubt that under high atropine treatment these troublesome attacks may cease entirely, at any rate for long periods. Their frequency and severity, however, vary so widely in the same individual from time to time, and are so readily influenced by emotional and other psychical happenings, that it is always difficult to be sure that they are permanently arrested or to name the exact agent which has stopped them for the time being. Though not merely a hysterical phenomenon, yet, in those liable to them, excitement, correction or having to do something they do not like will readily bring on an attack, while sufficiently strong suggestions of various kinds may prevent them or stop one that has begun. In one man (Case 25) an observant attendant in charge of the patient assures me that the attacks have been much less frequent since the patient was not allowed to lie down when one threatened to come on.

Discomforts Early in Treatment

Various discomforts were complained of in the initial stages of the treatment, but on the whole they were few and capable of relief. Among these were:

Occasional mental confusion or slight delirium coming on shortly after taking the drug and lasting sometimes for an hour or two in some cases temporary loss of memory and occasionally vertigo. Drowsiness about two hours after a dose has also occurred.

Visual disturbance due to paralysis of accommodation is common and tends to cause annoyance or even alarm. This can be relieved temporarily by (1/2 per cent solution of eserine) drops in the eyes and later by glasses adapted for complete loss of accommodation. In any case with a suspicion of glaucoma the treatment is contraindicated.

Dryness of Mucous Surfaces—Dryness of the mouth and throat occurred in a few cases and gave rise to difficulty in swallowing. Dryness of other mucous surfaces besides the mouth may cause discomfort. Thus in two women there was irritation about the vulva and in one man troublesome priapism. One patient complained of constipation with undue dryness of the anus. All these were relieved by a simple ointment.

Gastrointestinal upsets in the form of vomiting and acute diarrhoea occurred in a few cases. They were however only occasional and were relieved by ordinary measures without stopping the atropine.

Difficulty in starting micturition was observed in one or two of the men but was not of serious importance nor did it call for special treatment.

Hyperthermia during Treatment

A certain number of observers have recorded occasional rises of temperature during the taking of large doses of atropine. Such an occurrence after atropine has long been recognized by pharmacologists. According to Cushny (1936) atropine often induces a marked rise in temperature the cause of which cannot be said to be definitely known. According to Ott the dissipation of heat is increased but the heat formation undergoes a still greater augmentation. Sollmann (1936) says, "Atropine suppresses perspiration and thus causes a rise of temperature with moderate doses, notwithstanding the cutaneous vasodilatation." Larger doses produce a fall of temperature from lessened heart production. Dixon (1936) says:

It is not uncommon to find a small rise in temperature after taking a large dose of atropine. This is probably a direct action on the thermogenic centre. It cannot be due to a diminished loss of heat because the amount of heat dissipated is actually increased. In severe cases of poisoning the temperature rises sometimes very high, even to 107° or 108° F. It is this rise in temperature which is responsible for the vasodilatation of the skin vessels, it is an attempt on the part of the nerve centres to lower the temperature by increasing the loss of heat. It is evident that, as Cushny says, the cause cannot be said to be definitely known.

It was observed in four cases of this series. In three of these (Nos 1, 2, and 3) the circumstances are of especial interest in connexion with the above opinions as to its cause. These men were all in the same ward, and in each the dose of atropine had reached a considerable height (33.5 mg daily). A sudden spell of very hot weather had occurred in August, the ward thermometer registering 78° F. Each man's temperature went up to 104° F or rather higher. There was no discomfort other than thirst, and in each the temperature was easily reduced by sponging. It seems probable that a contributory cause in these three cases was an inhibition of sweating due to the atropine. In this connexion it is of interest to recall that more than one fatal case of hyperpyrexia has been described in chronic Parkinsonians. Astley Cooper (1936) mentions a fatal case of heat stroke apparently "due to failure to move out of the sun, and he adds (I think pertinently) *combined with stramonium medication*."

In one of the fatal cases with hyperpyrexia (temperature 109° before death) which I recorded in 1935 the question of it being really a heat stroke due to exposure had not occurred to me until reading Astley Cooper's paper. Inquiry, however, in my case showed that this man also had been sitting in the sun without moving for most of a day which happened to be exceptionally brilliant and hot. About 5 p.m. the attendant noticed that he looked ill. He was put to bed and found to have a temperature of 105°. In spite of treatment the temperature rose steadily, drowsiness increased to coma and before death at 7 a.m. next day the temperature had reached 109°. This man also was taking stramonium in full doses and had been doing so for some time.

These two cases taken together suggest that in persons under the influence of atropine in any form whatever may be the explanation the possibility of dangerous hyperpyrexia on exposure to a heat considerably less than affects normals must not be overlooked.

Occupational Therapy

Among those who have obtained the best results from high atropine treatment the importance of supplementing it by various forms of mental and physical treatment is generally agreed. This cannot be too strongly emphasized. In the early cases recorded by Kleemann (1929)

baths of various kinds, massage, and physical exercises formed a conspicuous and valuable feature of the treatment. At institutions where there are numbers of Parkinsonians such measures are more easily carried out although remedial baths, massage and machines for exercising are not available for treatment in this country as widely as in Germany yet it is not the exact physical nature of the supplementary treatment which matters so much as the suitable and regular occupation for mind and body. This can be carried out at any institution provided it is organized and supervised. Simple domestic duties easily devised occupations graded to suit the capacity of each individual games, physical drills, and competitions are quite as valuable as baths or massage, if not more so.

In private cases where treatment has to be carried out under home surroundings this "occupational therapy" using the term in its widest sense is often more difficult. It is not uncommon to see one of these patients after improving greatly in hospital go steadily back to his former condition on returning home even if atropine treatment is continued.

The importance of environment cannot be too strongly emphasized. All that the atropine does is to release the brake in the Parkinsonian's musculature. What use will be made of it depends upon what there is to do and what encouragement to do it.

There is still one other factor of great importance whether the treatment is carried out at an institution or in the private house—that is the personal will power of the individual himself upon which the effect of treatment largely depends. Without full co-operation it is impossible for benefit to be obtained or if attained maintained.

In some of the records published in Germany many of the cases are said to have left the institution fit for work (arbeitsfähig) as the result of high atropine dosage. In most of these it would seem that the Parkinsonian disability must have been only (1) or (2) and the psychotic disability Group B. If so in our experience a similar result would probably have been obtained by much smaller doses of belladonna or stramonium.

But once a Parkinsonian always a Parkinsonian and whilst the physical disability may have been so much relieved by treatment as to make the patient fit for work very few are in a condition to compete with normal persons in the labour market.

Summary

1 Treatment by very large doses of atropine (high atropine dosage treatment) causes remarkable improvement in certain cases of post-encephalitic Parkinsonism.

2 The greatest benefit is seen in cases in which the disability arises chiefly from muscular stiffness and excessive flow of saliva.

3 Improvement may also occur in tremor, in the frequency of oculogyric attacks and in various spasmodic symptoms. In these however, it is less in amount and more variable.

4 Cases in which psychotic disability is predominant and Parkinsonism is either absent or only slight do not usually show much benefit from this form of treatment. Where the psychotic disability is largely secondary to the physical disability removal of the latter by high atropine dosage may be accompanied by definite improvement in the former.

5 Under no circumstances does the Parkinsonian syndrome completely disappear, and unless the treatment is

maintained and reinforced by suitable environment, using the term in the widest sense there is usually a rapid return to the pre-existing condition.

Concluding Remarks

Where physical disability is maximal and psychotic minimal (Group B 3) treatment by very big doses of atropine is capable of producing results of a remarkable kind, provided that the physical disability has not caused serious deformities, and that there is full co-operation on the part of the patient. Conversely, where psychotic disability is maximal and physical minimal (Group A 1) it is not likely to be of much benefit. The fact that some cases not only tolerate massive doses but do not begin to improve until they are reached whilst others improve on doses within or but little beyond the limits given in the *Pharmacopoeia* suggests a quantitative factor in its action.

Its administration in massive doses is unnecessary in those cases of chronic epidemic encephalitis in which it is not likely to be of service, and uncalled for in any case until ordinary doses have been tried and failed. Otherwise there is a danger of bringing discredit on the most efficient agent we possess in relieving some of the disabilities of Parkinsonism.

A Hautant (*J Laryng* February, 1937, p 65) describes certain lesions of the larynx in which a differential diagnosis may be extremely difficult or almost impossible. In general tuberculosis of the larynx can be easily distinguished from cancer by the following characteristics. Laryngeal tuberculosis does not fix the vocal cords, it is accompanied by lung lesions and there are tubercle bacilli in the sputum in histological sections giant cells are seen. The exceptional cases where diagnosis is difficult are said to fall into three groups: (1) Unilateral tuberculosis, localized in the subglottic region. (2) Tuberculous tumour of the ventricle with quiescent pulmonary tuberculosis. (3) Cancer simulating tuberculosis owing to its situation and aspect. The author gives clinical examples belonging to each group with many excellent illustrations and diagrams. One of the photomicrographs shows a tuberculous giant cell in contact with a deep epithelial cord of a carcinomatous nature. The association of tuberculosis and cancer in the same laryngeal lesion has very rarely been observed. With negative findings in the lungs and sputum the limited tuberculous tumour may be confused with a simple neoplasm. In such cases the tuberculous mass sometimes invades the cartilage and fixes one cord confusion with cancer is then almost certain. In the event of the diagnosis as between tuberculosis and cancer remaining uncertain active laryngeal treatment must be carried out with extreme caution. An untimely surgical operation might cause a fatal attack of acute tuberculosis. Hautant relies a good deal on side-view radiographs of the larynx a method of investigation which appears to be little used in this country. One can see the outline of the thyroid and cricoid cartilages and shadows of tumour masses within those outlines.

SURGICAL INTERVENTION IN OBSTETRICAL PRACTICE

INDICATIONS FOR AND AGAINST*

BY

DAME LOUISE McILROY, D B E, LL D M D
D Sc, F C O G M R C P

In the time at my disposal I can only mention the outstanding indications for and against surgical intervention in obstetrical practice. I shall endeavour to discuss the subject from the standpoint of the general practitioner. It is true that major operations, such as Caesarean section have eventually to be referred to the specialist for their performance although the family doctor in many cases is the first to give advice as to the procedure to be adopted. It is generally agreed that the wider the experience one has gained in the management of obstetrical cases the more conservative one becomes in their treatment. Maternal mortality statistics published from all parts of the world prove that the practice of conservative methods in midwifery gives the most favourable results. Not infrequently it has happened with all of us at some time or other that more courage is required to leave well alone than to terminate the pregnancy or labour by some method of operation. My general rule is when in doubt do nothing. The old political quotation 'wait and see' is not a bad rule to follow in obstetrical practice. I might, however, qualify this by stating that once a decision has been made for operative intervention it should be carried out promptly with the best possible surgical and aseptic technique obtainable.

It must be remembered that obstetrics is not a branch of surgery, it stands alone, and has its own methods of procedure. It is the exercise of wise judgement that really gives good results.

Ante natal Complications

These comprise mainly the indications for (a) induction of abortion (b) induction of premature labour (c) version (d) operations for tumours complicating pregnancy, and (e) haemorrhages.

(a) INDUCTION OF ABORTION

With our modern methods of medical treatment induction of abortion is not resorted to so frequently as was the case in former years when often the sole method of treatment was the termination of the pregnancy. An example of this may be found in diabetes where the administration of insulin has proved so effective. In vomiting of pregnancy isolation of the patient and treatment of the symptoms of starvation by dieting have reduced the incidence of induction to a remarkable extent. I now practically never terminate an early pregnancy on account of vomiting. The three main conditions calling for the consideration of induction are cardiac disease, pulmonary tuberculosis, and nephritis.

In cardiac disease no definite rules can be laid down. Each case must be judged on its merits with due regard to the condition of the heart and its reaction to exertion and prolonged rest. It is advisable to have in consultation a colleague with special experience in this disease. The use of the electrocardiograph and x rays has helped very much in making a more exact prognosis than was formerly possible. I have again and again had experience of the improvement which takes place in a damaged heart by careful ante natal supervision and treatment.

* Address given to the Huddersfield Division of the British Medical Association February 3, 1937.

It not infrequently happens that in those cases in which there has been no treatment previously the heart is in better condition at the end of pregnancy than at the beginning. The strain of late pregnancy and labour however, must necessarily be considered when one is forming an opinion as to the advisability of the continuation of pregnancy. In 200 cases of heart disease treated in the Royal Free Hospital, a number of whom were sent in for the purpose of induction only 6 per cent had their pregnancies terminated. The mortality of these patients when followed up for a considerable period was 2 per cent.

In pulmonary tuberculosis the indications for induction in patients with early active lesions are more evident than in chronic cases. Treatment by artificial pneumothorax and other methods should be tried before resorting to induction. It must be remembered that any forcible surgical interference in these conditions is not advisable. I have seen serious haemoptysis follow a straightforward induction of abortion. The slow method of emptying the uterus by laminaria tents is to be preferred. I feel convinced that the termination of an early pregnancy will not be necessary once we have established proper medical treatment for these patients. They should have residence in a sanatorium without any break in the continuity of the treatment during the confinement and post natal period. It is the present method of turning these patients out of a sanatorium a few weeks before labour is due that is so detrimental to a possible cure. Sanatoria make no provision for maternity cases and are anxious to avoid all risk of the confinement taking place. The maternity hospitals avoid the admission of tuberculous patients as far as possible owing to the fear of infection.

In cases of nephritis with hypertension albuminuria etc., I have little hesitation in terminating a pregnancy when treatment by ordinary methods has failed. There is a risk not only of permanent damage to the kidneys but as is shown by the history of these patients when followed up death occurs within a few years of the confinement in quite a number of instances. The ovum frequently dies and may be extruded in a macerated condition, which goes to show that Nature herself has her own methods of treatment. A marked amount of albumin and persistence of a high diastolic blood pressure are indications for removal of the ovum. I have found that hysterotomy with or without sterilization has given very good results. The ophthalmological examination is often the deciding factor in the consideration of induction. Haemorrhages or destructive changes in the retina are an indication for intervention in most instances. I hope in the future that in these cases of nephritis some method of treatment will be found to obviate the necessity for termination of the pregnancy.

(b) INDUCTION OF PREMATURE LABOUR

The indications for and against this are much the same as for abortion. The problem in the case of premature labour is not an ethical one as the operation is performed in most instances to save the life of the infant—for example in cases of habitual death of the foetus at a given week of pregnancy. I have been trying the effect of medication by vitamin E—wheat germ oil—in a few cases with encouraging results.

In cases of marked pelvic contraction or disproportion where for example, the head cannot be pushed into the brim at the thirty-sixth week it is obvious that Caesarean section is indicated but we all have experience of the head which stubbornly refuses to enter the brim of the

pelvis until the last moment when it passes through without any injury to itself or the maternal structures. Trial labour, therefore, is essential in all doubtful cases. Hot sitz baths, sedatives, and anaesthetics during labour render its progress much easier. In cases where there is a doubt as to the possible necessity of a Caesarean section no vaginal manipulation should be carried out. For this reason surgical induction causes more risk if a subsequent Caesarean section has to be performed.

Labour is rendered easier in doubtful cases if careful dieting and walking exercises during pregnancy are advised. If fifteen grains of chloral hydrate are given every night for a week or ten days before labour is due rigidity of the cervix may be prevented.

(c) VERSION

Version is not necessary in the majority of cases of breech presentations, as most foetuses turn spontaneously before the thirty-sixth week. In my experience of antenatal examinations about 25 per cent of all cases have a breech position before the thirty-second or thirty-fourth week.

Version should be attempted only after a radiograph has been taken of the position of the foetus and the patient should be admitted to hospital or have the manipulation carried out in her own home. It may be necessary to give an anaesthetic. If version is easy the probability is that spontaneous version would have taken place if the case had been left alone. Version fails in most cases because of extension of the back and legs. It is a dangerous procedure in cases of toxæmia or nephritis as it may cause separation of the placenta and death of the foetus or even of the patient from haemorrhage.

(d) TUMOURS

Tumours of the ovary tend to twist during pregnancy and in most cases should be removed.

Fibroids give little trouble unless they cause pressure symptoms. If they occur in the pelvis Caesarean section and enucleation is the operation of choice. If the patient is young the uterus should not be removed if it can possibly be saved. I have performed Caesarean section in a young patient with a uterus studded with fibroids and have not removed them. They involuted, and the patient had no subsequent symptoms of pressure or haemorrhage. In the case of degenerating fibroids associated with toxic symptoms I treat the patient for toxæmia, and if necessary perform Caesarean section at term. Fibroids should not be interfered with during pregnancy unless there are symptoms of pressure or evidences of acute infection.

In some cases I have enucleated a degenerated fibroid from the uterine wall several weeks after delivery with successful results and without recourse to hysterectomy.

(e) HAEMORRHAGE

In toxic haemorrhage the less interference the better. If the haemorrhage occurs in the late weeks of pregnancy absolute rest in bed and the administration of morphine will be sufficient, this should be followed by treatment for the toxæmia. Rupture of the membranes may be necessary in some cases. I have given up packing the vagina and all manipulation. It is remarkable how well these cases do compared with those treated by surgical methods. One must always remember in these cases that the danger of any interference is shock, increased haemorrhage from lacerations and sepsis. In toxic conditions of the liver pressure by an abdominal binder is dangerous.

In placenta praevia intervention in most cases must be prompt if haemorrhage takes place. I have kept cases of slight haemorrhage under observation with good results, but there is always anxiety, as sudden and fatal haemorrhage may take place. Version, performed in order to control the placental bleeding by means of the foetal buttock, has its uses. Willett's clamp is useful if the head is down and the foetus not too premature. In central placenta praevia Caesarean section should always be considered if there is a living foetus.

Intervention During Labour

Forceps—The application of forceps is more of a problem in practice than one at first realizes. In most cases of domiciliary midwifery the practitioner is influenced to some extent by a desire to terminate the labour on account of the suffering of the patient and the risks to the foetus attendant upon delay. The anxiety of the relatives may tend to precipitate matters. The forceps rate in such practice is higher, therefore, than in hospital cases. The urgency for instrumental delivery can be avoided by the administration of sedatives in the first stage and anaesthetics such as gas and oxygen or gas and air, during the second stage. Forceful muscular exertion on the part of the patient should be avoided as it causes uterine fatigue. The lithotomy position gives more room for the head to come down to the outlet and simulates the Eastern method of delivery by means of the squatting position. I do not apply forceps when the head is high in the pelvis, and I consider the administration of pituitrin a danger except after the termination of the third stage of labour.

If the perineum is preventing the expulsion of the head or is showing signs of laceration a median episiotomy is of value. The lateral incision may prevent extension of the tear but I have found it difficult sometimes to get primary union. Undue stretching of the perineum is just as frequent a cause of rectocele as a lacerated perineum. Careful suturing of the perineum in layers will prevent subsequent prolapse. If primary union does not take place I make it a rule to have the wound thoroughly cleansed by swabbing with an antiseptic (dettol for choice) and in about ten days to freshen the edges and unite them by secondary suturing. As a rule the results are excellent and no repair is needed at a later date. It is a mistake to deliver a head rapidly by forceps, slow traction during the pains causes little injury. If the head lies for a prolonged period on the perineum without any progress forceps should be applied. In cases of foetal distress or prolapse of the cord forceps may have to be applied earlier than would be the case under normal conditions. If a patient is having few pains and the foetal heart is regular there is no necessity for terminating the labour, even though the second stage may have lasted for some hours.

Caesarean section is advised for cases of extreme disproportion, for central placenta praevia and where undue strain would be dangerous for the patient. In patients who have had previous stillbirths during labour or in the case of a breech with extended legs where the pelvis is rather small Caesarean section may be indicated. I always operate after labour has started as not infrequently the operation has been found to be unnecessary. The more experienced the obstetrician the fewer cases of Caesarean section he has to his credit.

The Third Stage of Labour

Uterine fatigue is the most frequent cause of retained placenta. Patience and time will effect its delivery.

Passing a catheter is often of advantage, and expulsion from the vagina may be effected if a light anaesthetic is given. In normal cases it is not necessary to massage the abdomen in the third stage. Massage often causes irregular contractions and retention. It is unnecessary to explore the uterus for retained membranes, they will probably come away as involution proceeds. If the membranes do not come away naturally in a day or two and give rise to local sepsis a glycerin drain may be advisable. When the placenta reaches the vulva the hand should not touch the abdomen, as it may produce constriction of the cervix, which would prevent expulsion of the membranes. Injection of saline solution into the umbilicus in some cases effects delivery of the placenta.

Manual removal of the placenta should be avoided, except for haemorrhage or complete retention, as it is not infrequently followed by some degree of pyrexia.

Puerperal Sepsis

There is no time to do more than mention this subject. With improved methods of treatment, as, for example, with prontosil in cases of acute blood infections surgical intervention has been much diminished. Hysterectomy has always seemed to me a mistaken method of treatment, and has been responsible no doubt for the loss of some lives. Drainage of the abdominal cavity does not seem to me a rational method in these cases, as the infection is not comparable with that of appendicular abscess or pyosalpinx. I have found serum of value in some cases, and of course fresh air, colon lavage, and blood transfusion all help towards a cure.

In local or uterine sepsis glycerin drainage is the best method of treatment.

In cases of septic abortion it is advisable not to remove the ovum or placenta when first seen but to delay until the patient's resistance has been improved with prontosil, etc. A glycerin drain may effect the spontaneous expulsion of the ovum. If not, removal of the uterine contents by the finger or forceps is not accompanied by much risk of disseminating the organisms by breaking down the barrier in the uterine wall. A mole which gives rise to haemorrhage should, of course, be removed as soon as possible.

In conclusion, we must remember that although we are often tempted to use surgical methods in obstetrical practice time and patience will do much to banish the possible complications which we apprehend. The results of operation at the moment may be dramatic but the dice are loaded sometimes against us in the form of shock to the patient, haemorrhage and sepsis. Masterly inactivity may seem to some to be poor treatment, but the results will often be infinitely better than those attained by surgical intervention.

A Alfano (*Rinasc. med.* January 31 1937 p. 47) states that recent studies of the extra articular manifestations of acute articular rheumatism have induced him to record the following case. The patient was a girl aged 13 who was suddenly seized with abdominal pain chiefly localized in the right side, constipation, vomiting and fever. The pain in the lumbar region which subsequently developed made it doubtful as to whether the condition was a retrocolic appendicitis or suppurative peritonitis. The subsequent course of the disease made the last diagnosis appear the most probable at first, but later the occurrence of pain in the typical situation showed the true nature of the disease.

AN UNUSUAL CASE OF HERMAPHRODITISM

BY

HAROLD CHAPPEL, M.Ch., F.R.C.S.

Senior Gynaecologist to Guy's Hospital

I put forward the details of this case as of considerable importance in having a direct bearing on the problems of sex, its origin, and manifestations.

Case Report

The patient consulted me when she was 18 years of age because she had never menstruated though she had had frequent manifestations of sexual excitement at irregular intervals and had become anxious as to their exact significance. Her general bearing was that of an attractive female, aware of her beauty both of face and figure. Her voice was pitched in the female register.

On examination she was found to be a beautiful woman remarkably well developed as far as her typically female body was concerned. The face was free from hair. Her breasts were large and full, her pubis covered with a mat of hair. Her pelvis was rounded and well developed. Her clitoris which bore to the naked eye a strong resemblance to a small penis not fused on its ventral aspect was conspicuous between her labia which were fully developed and definitely larger than the average. The vagina was about one and a half inches in length and terminated in a smooth rounded extremity but on removal of the examining finger it collapsed so as not to seem so long as the finger had indicated. She was very active sexually and had a lover who had frequent connexions with her, and during these she became very excited. This man an experienced bachelor had assured her that he was able to complete the act with great satisfaction in spite of the shortness of her vagina and that he had never had relations with such a passionate woman. These facts are mentioned to show that she was very highly sexed. Her sexual desires were invariably directed to males; indeed, she said she had rather an antipathy to females.

Desiring to settle in life and to cease her irregular friendships with her various lovers she consulted me again in 1921 with the object of having her "passage" elongated and asked if it were possible to make an artificial uterus so that she might have children. On examination I could not detect any sign of the presence of a uterus. I found in each inguinal canal a smooth rounded lump which was readily returned into the abdominal cavity by slight pressure but appeared again when the pressure was removed. She complained that squeezing the lump caused a pain which she herself described as sickening. I explained to her that it was possible to make an artificial "passage" for the sake of intercourse but that it was not possible to construct a uterus from which she could bear children. I added that there was a definite risk to her life in the former procedure if carried out by the abdominal route, and she wisely decided not to undergo it. Noting the elasticity of the perineal tissue an elastic T-bandage was devised which kept up a constant pressure on a metal dilator. This was worn during sleep and for as long a part of the day as possible. Rapidly it became possible to increase the size and length of the dilator and the patient's persistence was rewarded by the development of a passage three inches in length which on superficial examination bore a strong resemblance to the lower end of a normal vagina.

OPERATIONS

Three years later she came to see me again because the lump in the right groin had become painful and had increased in size and an operation for the cure of an inguinal hernia was undertaken. The lump was exposed and was manifest a small testicle complete in every detail except that no vas could be found. It was replaced in the abdominal cavity and the canal closed. Two years later a similar operation

for the same reasons was performed on the left side when as on the previous occasion what appeared to be an undoubted testicle was replaced in the abdominal cavity. Four years later the hernia on the right side caused her much pain and she said the lump was trying to reappear. This time she insisted on its removal. This was carried out and the appearance of the lump at the previous operation was confirmed. It turned out to be a definite testicle complete in every detail. After its removal her sexual ardour was considerably lessened, but remained identical in its direction.

The specimen was examined after removal by Dr. Nicholson, professor of morbid histology at Guy's Hospital, and his report is appended.

"The specimen was instantly identifiable with the naked eye as a testis and epididymis. The former measured 3 cm. in length, 2.4 cm. in breadth and 2 cm. in depth and was covered externally by peritoneum. On section it was pinkish in colour and studded everywhere with minute granules, slightly raised above the surface. The upper pole passed gradually into the thickened head of the epididymis. Elsewhere it was surrounded by a dense tunica albuginea. The epididymis consisted of fibrous and adipose tissue with numerous small lumina.

On microscopical examination the testis presented the typical appearance of the atrophied organ (see figure).

The spermatic tubules were thick and consisted of a broad hyaline basement membrane surrounding a lumen in which a few degenerate cells of irregular shape were present. There were no signs whatever of spermatogenesis. The intratubular stroma was dense and non-cellular but contained large numbers of big intensely eosinophil interstitial cells solitary and in groups. They often formed incomplete envelopes around the tubules or were aggregated into definite nodules or adenomata, the largest of which measured 1 to 2 cm. in diameter. The tubules of the epididymis were lined with columnar epithelium on which cilia were visible. Their lumina were always empty. They were surrounded by thick fibromuscular envelopes. The vessels of the pampiniform plexus were numerous and all their coats more especially the media, were sclerosed. The vas deferens was not identified.

On the three occasions when the patient was anaesthetized I had taken the opportunity for a thorough examination of the pelvis and there was no sign of any structures in the pelvic cavity which might indicate the presence of ovaries.

This case appears to me to be of great interest from several points of view. Here we have a beautiful fully developed woman with all the physical characteristics of the so-called female and yet she has no ovarian secretion or uterus—nor has she ever had. Clinical observation of human beings shows of course that the original division into male and female is in reality a very superficial one and can only be maintained on the anatomical ground of the gross appearance of the external sex organs. Certain physical and mental characteristics are generally accepted as appertaining to the males and females of the species, and it is a platitude to observe that there are

very few pure males or females in the human species but that the vast majority of individuals are a mixture in varying proportions of the male and female elements. Their characteristics are usually considered to be due to the secretions of the gonads. The present case directly negatives this supposition and proves that we must look further back for their origin. This woman had never possessed ovarian tissue at all; indeed, she had testicles.

Factors that Determine Sex

The origins of all the ultimate characteristics of the future individual are contained, of course, in the original fertilized and developing ovum and must be derived from the original spermatozoon and ovum, which contain the factors that determine the particular type and its sex. This case shows that these factors must be independent of the gonads. Indeed the factors that determine the type of the several characteristics of a particular individual must determine also the type of the gonads that will be present in that individual.

The type of each individual is developed with the gonads and not because of them, the gonads being just one of the elements in the structure of the individual and not, as was supposed, the structures that determined the characteristics. Thus an individual may be physically very feminine, mentally a mixture of male and female and yet have testicles or any variety of the male or female organs. The truth of this has appeared obvious to me for many years but I have not been able to demonstrate it completely before, although it was suggested by a mass of evidence from clinical observations. The degree of development of the external sex organs varies greatly in each individual. In many females the clitoris and labia approximate quite closely in appearance to a penis and a scrotum not of course fused in the midline. The degree of development of the male organs varies too, but what is more important to observe is that the sexual characteristics associated with these developments are just as variable and are not commensurate with the degree or type of anatomical development. For example, great physical development is not necessarily associated with great sexual ability or desire, nor is great physical beauty necessarily associated with great sexual attraction or small anatomical development of the sex organs. This is equally true of the mental characteristics of the individual in relation to the degree of development of the sex organs and the type of gonads, the anatomical, mental, and sexual characteristics of each individual being very largely independent of one another. Indeed it appears to me simple to deduce that the superior intelligence of the female is the result of her physical disadvantages.

The value of the ovarian secretions is, then, much more superficial than is usually supposed and this is of great interest in view of the attention drawn to them by recent work. The missing secretions in any particular individual can be augmented by the administration of artificial substitutes and important superficial changes be thereby produced, but the type of the individual is not altered. Also the ovaries have been removed surgically in a large number of women without making a radical change in the type, though in a proportion of cases certain symptoms will follow and some of these may attract a great deal of attention.

Sex Problems

Clinical observations have confirmed me in the belief that the pure male type and the pure female type are seldom satisfactory, the former generally being lacking

in real intelligence and the latter in physical power. The best human beings are those in whom there is a considerable admixture of the characteristics of both sexes, with an interplay of the elements and it appears to me that for a man to be what is commonly known as "successful" he must possess a considerable amount of the mental attributes of the female, and the "successful" female must possess a considerable amount of the physical attributes of the male. The so-called war of the sexes is therefore about as absurd as any other war, and the question as to who fights whom, and on which side, must often be difficult to answer.

Of late years sex problems have been more openly discussed, and certain advantages have accrued from this. On the other hand types of sexual activities between persons of the same sex have been dragged into the light from the relative obscurity that previously had partially concealed them and at times even have been exalted by certain authors to such an extent as to become a menace to society, a great deal of harm resulting. The position regarding them therefore needs some clarification. There are individuals with certain male externals who have an excessive amount of the female in them, and females with very obviously excessive amounts of the male apparent in their appearance, movements, and general mannerisms. Some of these indulge in sexual perversions, and the natural resentment that is felt against these activities is often toned down by the illusion that this is a glandular problem and so calls for sympathy and not drastic opposition. No one would justify excessive violent attacks by a male on a female because of the activity of the secretions of his sex glands. Again, it is true that the aggressive sexual female has often a great deal of the male in her but this is not regarded as a justification for gross sexual activities on her part. The case to which I have referred in detail shows that it is possible for an individual to have a very considerable mix-up of elements and yet confine her sexual activities entirely and successfully to the opposite sex.

The causative factors of homosexuality and Lesbianism are not to be found therefore so much in the secretions of the gonads as in the type of the individuals concerned. Their behaviour should not be regarded as justifiable on the ground of these glandular secretions nor should it be held that it is impossible for them to learn and cultivate an adequate control. In this matter the legal and medical professions are often found at variance and are often led away from the main issue the former being more interested in upholding the majesty of the law and the latter in attempting to find a cause for the behaviour and to supply a suitable remedy. It is just as possible for the participants in these practices to learn control as it is possible to control any other bodily desires normal or abnormal. It is vital that they should be made to realize that their practices are not excusable on the grounds of the secretions of the sex glands as, failing this they are dealt with drastically by the law—and justly so—for the obvious benefit of the herd in which we live.

The December issue of *Medical Life* is an Army Medical Library number commemorating the centenary of the foundation of the Army Medical Library at Washington. In addition to other papers it contains greetings from the Royal Society, the oration delivered on the occasion by Sir Humphry Rolleston (of which an abridged version appeared in our issue of November 28, 1936) and a portrait of the late medical historian, Colonel Fielding Hudson Garrison.

DERMATITIS ARTEFACTA—A NOTE ON AN UNUSUAL CASE

E. W. PROSSER THOMAS, M.A., M.D.

Registrar Skin Department St Thomas's Hospital

The term 'dermatitis artefacta' is reserved for those cutaneous lesions which are produced by the patients themselves with intent to deceive. It does not therefore include the group of self-inflicted dermatoses known as neurotic excoriations in which the patients neither intend nor practise deception but are the victims of an irresistible desire to pick, scratch, or otherwise injure the skin, nails or hair (trichotillomania), this impulse in some instances may have originated in a pre-existing or existing true dermatosis, such as scabies or acne (*Brocq's acne excoriée des jeunes filles*). Such cases are quite distinct clinically and psychopathologically from the group of 'feigned' eruptions to which the ensuing remarks are confined and of which the case reported is an example.

Diagnosis

Dermatitis artefacta is by no means a rare condition, but to anyone who has not previously encountered it the possibility that he is dealing with a self-produced dermatosis might not easily come to mind and it is probable that a number of cases, especially of the milder type are missed.

The diagnosis may be comparatively obvious or extremely difficult. The subjects may be men or women but the great majority are women. They are usually young—between 15 and 25 years of age. There may be nothing in their past histories suggestive of any psychological abnormality, and they are not the type of person commonly called nervous, on the contrary, they often present a curiously unemotional, almost indifferent attitude on examination, which is reflected in their facial expression to such a degree that their physiognomy, though difficult to describe may be quite distinctive and of valuable help in diagnosis. This apathy, if it may be so called is neither to their environment nor to their interrogator. They are often intelligent perhaps above the average, and answer questions with apparent frankness though they do not care to volunteer much information concerning themselves or their condition. Their apathy is only towards their disease and in this direction their lack of interest is so unnatural as to be striking. They rarely complain, and may regard a number of heavily infected discharging lesions with what appears to be almost a complaisant and contented eye.

The lesions themselves present great variety in shape and character as would be expected from their aetiology. They may be linear, striped, band-like, disk-shaped or have a fantastic outline. They are constant only in one particular—that they do not conform to the lesions of any recognized dermatosis. Their border is important: it is usually sharply defined, pointed or angular and may have a thin line of erythema between it and the surrounding skin which is probably quite healthy. If a liquid agent has been used there may be one or more drop-shaped or streak-shaped subsidiary lesions caused by spilling or running. The location of the lesions is important. They naturally occur in places easily accessible to the hand: the left arm and side of the body are therefore favourite sites but the face or neck,

buttock or legs, may be chosen. The lesions have a habit of appearing, multiplying or relapsing during the course of a night, and are not preceded by any local cutaneous disturbance. The distribution may be totally unsymmetrical or impossibly symmetrical.

The agents employed to produce these lesions are also of great variety: they may be chemicals, such as carbolic or sulphuric acid, silver nitrate, caustic soda, or lysol; all kinds of instruments, such as knives, forks, brushes, etc. or simply the finger-nails or manual rubbing or pinching. The character of the lesions themselves consequently varies according to the type of agent used. Anything may be encountered from simple erythema to extensive tissue destruction. The superaddition of pyogenic infection further complicates their nature and appearance, and the infected lesions may be particularly difficult to identify.

Most perplexing, however, is the psychopathogenesis. It is true that in a certain number of the cases the motive appears to be to excite sympathy, to evade work, or to secure compensation but even in these patients as Goldsmith (1936) points out, the fact that the method chosen of achieving the purpose is a false one, and that the self-produced illness is usually out of proportion to the often trifling advantage gained, makes manifest the existence of a specific psychic abnormality. There are moreover many cases in which it is impossible to define a motive of any kind.

The following case report of a patient recently under my observation, although an extreme example of the condition, illustrates some of the points mentioned concerning difficulty both in diagnosis and in definition of motive.

Case Report

The patient was an unmarried woman 31 years of age. Apart from tonsillectomy and appendicectomy she had been healthy until the age of 22. She stated that all her life she had occasionally suffered from chilblains and had had numb feelings in her fingers. There was nothing noteworthy in her family history.

HISTORY

About nine years previously while she was training as a nurse a small lesion like a chilblain appeared at the extremity of her left little finger. It rapidly became black and began to extend. Amputation was performed at the distal interphalangeal joint. The wound healed normally and remained healthy. A few weeks later however a similar area of dry gangrene began around the nail of the left ring finger. The patient was then admitted to hospital in London where a diagnosis of Raynaud's disease was made. Alcohol was injected into the tunica adventitia of the left brachial artery. It also became necessary to deal with the affected finger by amputation although there had apparently been some improvement in the lesion following the injection. She was discharged from hospital about ten days later.

After a few months, however a new patch of gangrene appeared this time the left middle finger was affected. Amputation was again resorted to owing to signs of rapid extension of the gangrene. From then on similar lesions continued to develop at intervals of six to seven weeks the scar of the latest operation often being the site of the new gangrene. The disease was confined to the left upper limb. The succession of amputations (some thirty three in all) resulted in the complete removal of the arm up to the glenoid fossa of the scapula. The operation of left cervical sympathectomy was also performed. During the intervals between operations the patient stated that she had felt perfectly well except for spasms of pain in the stump for which she had received injections of heroin. Whenever she was not in hospital she pursued a normal life and kept up her swimming, badminton and other exercises. The last of this

series of operations had taken place about three weeks before I saw her.

She was a pleasant looking intelligent girl apparently in the best of health. There was an operation wound at the shoulder practically healed, otherwise nothing abnormal physical or mental could be discovered. She stated that she had come to London for some manipulative treatment to her neck as a last chance of curing her complaint. She was very cheerful—remarkably so when one considered the ordeals she had suffered during the past nine years and the imminent possibility of the development of yet another patch of gangrene. She spoke of this being likely to appear in about three weeks time which would make an interval of some six weeks after the last operation this being the interval she had become accustomed to expect. As however there was now nothing remaining of her left arm that could be amputated she did not quite know what would happen to her should the gangrene reappear at the shoulder and presumed that if it did she would die. She made no complaint hoping for the best from the new treatment and impressed one as being an extremely brave girl.

TREATMENT

A few days after beginning treatment which apparently consisted merely in light massage to the neck she was found in a faint outside her bedroom. She could not remember what had happened but stated that she had had similar attacks during the past few years for no obvious reason. She also developed retention of urine and required catheterization. This too had happened a number of times previously—sometimes when she had been in hospital. A few days later an attack of aphonia came on and lasted five days. She then said that she often lost her voice. One attack had persisted for ten weeks. She also mentioned that she was subject to sleep walking.

After a short rest following the fainting attack she resumed massage for about a week and then came an urgent message to see her. She was rolling about in convulsions of pain and a new patch of gangrene had appeared. Morphine had to be given, and later that day several injections of heroin which though they quieted her to some extent seemed to have little effect on the spasms of pain. On examination there was a circular gangrenous looking area about the size of half a crown in the middle of the operation scar. The epidermis was unbroken. In the centre it was black but faded gradually towards the periphery. The edge was sharply demarcated by a thin zone of erythema from the surrounding skin, which was normal and healthy. To one side of this lesion was another of a curious shape and character: it was a small triangle of which the border only was erythematous. There was also a third tiny nondescript erythematous lesion.

A diagnosis of artefact was made and the following day the patient was admitted to hospital. She was most unwilling to go but was persuaded by her father who had been sent for from the country. On admission her right arm was immediately put up in a splint to prevent possible interference. The gangrenous looking area began to diminish without treatment of any kind. From the moment of arrival at hospital she did not complain of pain and it was difficult to believe that only a few hours earlier she had urgently needed heroin. By the end of a week the principal lesion had resolved considerably and the small erythematous ones had vanished. She then left hospital.

Commentary

This case presents the remarkable picture of a self-inflicted dermatosis maintained intermittently over a period of nine years and achieving so successful a deception both in London and the provinces as to result in the piecemeal removal of an entire limb. The evidence leaves no reasonable doubt as to the diagnosis: recurring areas of dry gangrene confined to one arm and affecting the skin only (at operation the underlying tissues were found to be normal) do not conform with the lesions of any recognized disease: the peculiar nature of the latest lesions

themselves and their spontaneous resolution when interference was prevented, the characteristic mental attitude of the patient and the occurrence of other psychopathogenic manifestations, such as aphonia retention of urine, somnambulism, and fainting attacks all indicate the diagnosis of artefact of hysterical origin. That the deception should have been practised with such drastic effect is striking but by no means unique. According to Eller (1929), many cases have been cited in the European literature of amputations of one or more limbs having been performed on patients presenting large areas of gangrene of idiopathic origin which subsequently were proved to be due to the application of caustics by the patients. Simpson (1917) refers to a case recorded by Heidingsfeld of a woman who had serenely permitted the complete amputation of both breasts and one leg and had given consent for the removal of an arm before her condition was recognized. The lesions were those of gangrenous dermatitis and had been variously diagnosed as syphilis, tuberculosis, and malignancy. In addition to the operations she had received intensive salvarsan therapy.

Another extreme case, reported in the *Presse Médicale* (June 10, 1908) was of a man of 30, who produced black gangrenous patches on his arm with caustic potash. He consulted fifteen doctors in turn, and preserved their names, addresses and diagnoses which had included those of trophic lesions, neuritis, myelitis, syphilis and tubercle. He had received a variety of treatment, including stretching of the brachial plexus. Finally, amputation of the arm was performed. The other arm then became affected, after which his condition was recognized and apparently he was cured by psychotherapy. Lancashire (1922) who alludes to this case, cites one under his own observation of a young lady a musician who repeatedly developed lesions on her face and neck on the days when she was engaged to appear at a concert. It was impossible to define a motive and she privately confessed that some uncontrollable impulse made her mutilate herself in this manner on the very day when to do so would prove most disastrous for her. Of the milder type of case more generally encountered an instructive example was reported by Gardiner (1930). The patient was a woman of 26, who suffered from a bullous eruption of the chin, neck and sternum. Even after admission to hospital the lesions continued to appear until it was discovered that the patient was producing them herself in the bathroom by means of fly blisters which were found concealed in her handkerchief. Fly blisters were also found in the bed she had vacated at home.

"Belle Indifference"

It seems certain that a number of these patients are hysterical. The peculiarly calm mental attitude previously mentioned as being so often met with in subjects of dermatitis artefacta is apparently a characteristic feature of hysteria and was described by Janet as *belle indifference*. This attitude can be understood when it is realized that hysteria is a special type of reaction to difficulties that the physical symptoms represent the solution of some problem of everyday adaptation and that they are misinterpreted by the patient's consciousness (Henderson and Gillespie 1936). In the present case this *belle indifference* was very striking as also were other hysterical stigmata such as aphonia retention of urine and fainting attacks. A further question of great interest is that of dual personality. May hysterical subjects produce their lesions and not be conscious afterwards of having done so? Devine (1923) states that it is not necessary to suppose that the

hysteric is aware that his symptoms originate in his imagination, and that, even in the case of self-inflicted lesions, it would seem that his capacity for self-deception blinds him as to their origin. Dore (1926) reported the case of a girl of 19 with lesions on her arms. Stoddart considered her case to be one of dual personality, the patient being unaware that she produced the eruption herself. O'Donovan (1927) also inclines to the view that the patients possess a double personality, on which account it is practically useless confronting them with their misbehaviour. MacCormac (1926) wrote to some patients who had been treated at the Middlesex Hospital and found that of five who responded one had either forgotten that she had produced the lesions herself or was unaware of having done so, as she inquired whether the skin condition was liable to recur now that she was married, and if it would have any effect on her future children, another patient seemed to have no recollection whatever of her dermatosis, and stated that she had never been in the Middlesex Hospital. Simpson (1917) also remarks that one of his cases had apparently forgotten that she had consulted him previously with the same condition although on that occasion he had informed her that he knew she was producing the eruption herself. MacCormac believed that the explanation lay in the habit of burying the memory of unpleasant events in the subconscious mind rather than in the theory of double personality.

These and other perplexing questions concerning the psychopathogenesis of dermatitis artefacta can be clarified only by co-operation between dermatologist and psychologist in a series of cases.

C Spampinato (*Policlinico Sez. Chir.* February 15 1937 p 95) has collected 130 cases of which four are original of dislocations of the cervical vertebrae, exclusive of the atlas which he classifies as follows: (1) complete dislocations, (2) subluxations, (3) unilateral, (4) bilateral, (5) forward dislocations, (6) backward dislocations, (7) dislocation of a single vertebra, (8) multiple dislocations, (9) pure dislocation, (10) fracture dislocation. In eighty-eight out of 122 dislocations there was no spinal paralysis while in twenty-four the dislocations were complicated by paralysis. Among 102 cases in which the dislocated vertebra was identified the fifth came first (40 per cent) and then in order of frequency the fourth (21 per cent), sixth (14 per cent), third (12 per cent), second (11 per cent) and seventh (5 per cent). As regards treatment in cervical dislocation without spinal symptoms if the patient is seen at once reduction under general anaesthesia should be tried but if this is not successful continuous extension should be employed. If the dislocation is accompanied by spinal symptoms reduction should be first tried but if this fails operative or expectant treatment should be carried out. In some severe dislocations that cannot be reduced without operation spontaneous improvement resulting in complete recovery may ensue.

IMMUNIZATION AGAINST DIPHTHERIA WITH ALUM-PRECIPTATED TOXOID

EFFICIENCY, DURATION, AND GRADE OF IMMUNITY

BY

GEORGE CHESNEY, M.B. B.Ch., D.P.H.,

Deputy Medical Officer of Health Poole

I have reported previously the results of Schick tests on 162 children about two months after 0.4 ccm of alum-precipitated toxoid injected three to four weeks after an initial dose of 0.1 or 0.2 ccm (Chesney, 1936). Only one child was positive, giving a conversion rate of virtually 100 per cent. Using a similar two-dose method Parish (1936), in 164 children obtained equally satisfactory results.

Efficiency

The majority of children immunized in Poole (population 67,000) have belonged to the middle and lower classes. A severe epidemic of diphtheria occurred in 1929-30, but the attack rate has now dropped to a low level in comparison with the figures for London and for England and Wales.

Diphtheria Attack Rate per 1 000 Population

	1929	1930	1931	1932	1933	1934	1935	1936
Poole	4.25	3.25	1.51	0.94	0.19	0.14	0.27	0.29
London ..	2.68	3.03	1.95	1.88	2.25	2.81	2.25	—
England and Wales	1.59	1.84	1.26	1.08	1.18	1.70	1.60	—

The processes of natural immunization have lately been minimal. During the last three years nose and throat swabs from 500 children, who had incidentally some local abnormality did not reveal a single positive culture. The Schick-positive rate on primary tests, mostly of children over 10 years of age, has been high from 1930 to 1936: it was 75.8 per cent of 1125 children, and in 1936 78.6 per cent of 210 children. At present the rate for all children under 10 years is probably 80 per cent or higher.

Since my former report in February 1936, a further 1038 children have been immunized making a total of 1,200 children immunized with the two small-dose method. Of these 1078 have been Schick tested two months after the second dose and only two children have shown a Schick-positive reaction. The efficiency of immunization is therefore approximately 100 per cent.

Duration of Immunity

One hundred and twelve children who had been immunized with two small doses of APT and found Schick-negative when tested two months later were again tested eighteen months or more after the previous test: all were still negative. This result is the more significant for in 80 per cent of these children the fourfold Schick toxin test was used (see later).

Grade of Immunity Reached

I was interested to inquire whether the method of immunization in use converted children previously Schick-positive to the 'just-negative' condition or to a higher level. I therefore used 'fourfold' Schick toxin (kindly placed at my disposal by the Wellcome Physiological Research Laboratories). Glenny and Waddington (1929) showed that multiple Schick dilutions could be used

to test for a higher grade of immunity than the standard dilution. A child who is negative to the fourfold dilution has a higher level of antitoxin per ccm than one who is just negative to the standard but positive to the fourfold dilution. Five hundred and sixty-four children were tested with the 'fourfold' and 514 with the standard dilution. Only two positive reactors were found in the whole group, and both were positive in the ordinary Schick test. The blood of one of them was tested by the kindness of the staff of the Wellcome Physiological Research Laboratories and 1/50 of a unit of antitoxin per ccm was found.

I have also reported the results of Schick testing 127 children who had been immunized with formol toxoid: of ninety-four tested with the fourfold Schick dilution 87.3 per cent were negative and 12.7 per cent were positive, whereas of thirty-three children tested with the standard Schick dilution 97 per cent were negative and 3 per cent were positive. In forty-five cases the two tests were used simultaneously, and forty children were negative to both strengths: four were negative to the standard and positive to the 'fourfold' and one was positive to both standard and 'fourfold' (Chesney 1935).

With APT the Schick-negative rate was consistently high with both the standard Schick toxin test and the fourfold, and the results suggest that APT gives a higher level of immunity than formol toxoid.

Reactions of Immunizing Injections

No material difficulties have been encountered in the work. Following the initial detector dose of 0.1 ccm 3 per cent of the children showed mild local reaction; only 0.1 ccm or 0.2 ccm was therefore injected into those subjects as the second dose. By this procedure severe local reactions were avoided. In four children who gave a history of a blow on the arm during vigorous games a slight swelling formed eight to twelve days after the second dose from which a small amount of sterile discharge was easily evacuated. Subsequently the lesions healed rapidly.

Conclusion

Alum-precipitated toxoid used in two doses of 0.2 ccm and 0.4 ccm at an interval of four weeks gives a high level of Schick immunity. The initial small dose acting as a detector of hypersensitive persons eliminates reaction difficulties. The high Schick negative rate obtained obviates the necessity for routine Schick testing after immunization.

Summary

1 Of 1,200 children immunized with APT—0.1 or 0.2 ccm followed by 0.4 ccm four weeks later—1078 were available for retest two months later. In only two children was the Schick test positive. The immunizing efficiency of the prophylactic, therefore, approached 100 per cent.

2 The grade of immunity reached was high for over 99 per cent of the children tested with the 'fourfold' Schick dilution were negative to this test.

3 One hundred and twelve children who had been negative two months after immunization were retested eighteen months later: all were negative.

4 Reactions immediately after injection caused no material trouble and no interference with work. Small local lesions formed eight to twelve days after injection in four children who had received knocks on the arm in vigorous play: the slight discharge was sterile and disappeared rapidly.

My grateful acknowledgements are due to Dr R. A. O'Brien and his colleague Dr H. J. Parish for supplies of test

materials and valuable advice and assistance and to Dr R J Maule Horne for helpful facilities and co-operation in this work

TREATMENT OF HAY FEVER BY INTRANASAL ZINC IONIZATION

PRELIMINARY REPORT OF 243 CASES

BY

LIONEL D BAILEY, C B., M C., M R C S

Superintendent Physiotherapy Department St George's Hospital

AND

CLIVE SHIELDS, B M, B Ch

Assistant Superintendent Physiotherapy Department St George's Hospital

In 1936 the opportunity occurred at St George's Hospital of treating a number of cases of vasomotor rhinorrhoea by intranasal zinc ionization. Owing to the number of applications for treatment received (over 2,000) it was realized that the normal staff of the physiotherapy department would be unable to deal with more than a small fraction of these cases. Four special hay fever clinics were therefore set up and the services of five extra assistants accepted in order that a rapid statistical study of the method might be made. We desire to record our thanks to these voluntary workers for their invaluable assistance and to the Medical Committee for permission to establish the clinics.

During the period under survey 243 cases were treated, these were of both sexes and the ages ranged from 5 to 77 years. A special analysis of 100 cases showed that 88 per cent were of the seasonal type. 12 per cent were of the non seasonal variety and presented symptoms of varying severity throughout the twelve months. In only one case of seasonal vasomotor rhinorrhoea was there failure to give a considerable measure of relief; the only complete failures met with were in non seasonal cases of long standing.

It should be emphasized that the figures in this paper and the conclusions drawn apply to the 1936 season after treatment earlier in the year. By complete relief of all symptoms is not meant cure of the disease and in fact arrangements have been made for the cases already treated to have at least two applications in 1937.

In the present series the patient was first examined for infection of the paranasal sinuses, septic tonsils, dental sepsis or gross structural abnormality of the upper respiratory passages. Intranasal ionization was not given until these, if present had been dealt with. The routine practice was to give three treatments at intervals of one week; a few cases required as many as five applications; some were completely free after one. As a general rule the treatment was not given unless there was a chance of shortening the subject's season by at least four weeks.

In no case in the series was any anxiety caused by the primary or secondary reaction. There were no complications such as acute sinusitis, anosmia, otitis media or extensive sloughing of the nasal mucosa. One case of mild cocaine idiosyncrasy was encountered.

No other treatment for the condition was given except that in a few cases where the secondary reaction was more

marked than usual ephedrine 1/2 grain and sedobrol 2 tablets, were ordered that night. No sprays, douches, or local applications were prescribed, and the patient was asked to omit these if already in use.

It should be stated that the great majority of cases had had other treatment in previous years without relief, and from the fact that the average duration of symptoms was eleven years it will be realized that the condition was in most instances well established. Previous treatment took the form of desensitizing injections, injections of peptone, local applications, dietetic restrictions, and operations such as submucous resection, ethmoidectomy, antrostomy, etc. In many instances the patient had had more than one of the above methods applied without improvement.

Details of the technique employed are not included here as they have already been published.¹

The following table shows the results obtained

Complete relief of all symptoms	57.6%) 93.6%
Considerable relief	36.0%	
Some improvement	5.0%	
No improvement	1.4%	

Conclusions

1 The technique employed is safe and complications are not met with.

2 The method gives a satisfactory result in the great majority of cases of seasonal vasomotor rhinorrhoea, and in many cases of the non-seasonal type.

3 The treatment frequently gives relief when other methods have failed.

It is hoped in due course to publish a "follow up" of these cases, and to record any remote after-effects.

Clinical Memoranda

Thrombosis of Subclavian Vein Complicating Hyperthyroidism

The following case is of interest since venous thrombosis is a rare complication of thyrotoxicosis.

A single woman aged 47 who was employed as a sewing machine operative first consulted her doctor on May 30, 1936. She had been at work until a few days before this but stated that for twelve months she had suffered from attacks of palpitation and dyspnoea on exertion. She had lost weight and more recently had sweated excessively. She admitted that she was unduly nervous and that her limbs trembled. When seen by her doctor the pulse rate was irregular—200 per minute—and the thyroid was slightly enlarged. There was no definite exophthalmos. She was kept in bed on bromide and digitalis therapy for three weeks. The rate fell to 180 but was still irregular. On June 23 she was admitted to St James's Hospital Leeds.

She was grossly thyrotoxic. The pulse was 144 and irregular (fibrillating) the temperature was 97 F and the respiration ranged between 24 and 36. The veins of the neck were overfilled. The apex beat was just inside the mid-clavicular line though the heart was overacting grossly. The liver was palpable. There were moist sounds over the right lower lobe. The thyroid was soft and slightly enlarged. There was a fine tremor of the hands and a trace of albumin was found in the urine.

On the morning of June 30 seven days after her admission to hospital she awoke to find the whole of her right arm swollen and blue. She complained of aching pains along the inner side of the arm and forearm. Although the patient was

right-handed she did not remember performing any unusual movements involving abduction of the right arm. There was pitting on pressure. The radial pulse was alike on each side. The veins over the anterior and posterior folds were dilated. The lower half of the internal jugular, the external jugular and the axillary veins could be felt as solid tender cords. The temperature remained normal except on the evening of the eighth day when it rose to 98.6° F. There was no evidence of trauma or constriction of the arm by her nightdress sleeve. No focus of infection was found. All the teeth had been removed some ten years previously. The tonsils looked normal and there was no sore throat. A throat swab disclosed nothing of note. There were no septic abrasions of the skin, and no vaginal discharge. The urine contained a trace of albumin but no pus. There was no discharge from the ears. The x-ray examination revealed no sign of cervical rib root abscess or suppuration in the nasal sinuses. The Wassermann reaction was negative. There were one or two old calcified glands on both sides of the neck.

The arm was elevated on pillows and pressure was applied by alternate layers of wool and flannel bandages. She was given Lugol's iodine 10 minims three times a day and improved dramatically. The pulse rate began to fall within forty-eight hours and in fourteen days was 72 and regular. Concurrently the pain in the arm disappeared and the swelling gradually subsided. On July 30 a subtotal thyroidectomy was performed by Mr G. Armitage. The patient's convalescence was uneventful. Her condition improved rapidly and she was discharged from hospital on August 22.

On December 8 she was seen again. She had gained 18 lb in weight but her pulse rate was again 136. There was still a slight tremor of the hands and she still complained of periodic mild attacks of palpitation on exertion. When she had been using her right arm more than usual she had noticed some swelling of the upper arm and on the back of the hand. On examination of the right arm no oedema was seen, there were no dilated veins, and the temperature and the colour of the skin were normal. Measurements revealed that on the right side the upper arm was 1½ in. and the fore arm 1 in. greater in circumference than the corresponding measures on the left side.

At the time of writing—January 1937—there is still a little swelling of the right arm but this is diminishing. The difference in circumference is ¾ in. in the upper arm and ¾ in. in the lower arm. Apart from this she is quite well and anxious to return to work. The pulse rate is 72 and regular and the heart is normal in appearance on x-ray examination. The urine contains no abnormal constituent.

In a search through the literature we have found no mention of venous thrombosis complicating thyrotoxicosis. In view of the increase in the circulatory rate in the latter condition we feel that this occurrence must be one of considerable rarity.

Honorary Assistant Physician

MICHAEL C. OLDFIELD F.R.C.S.,
General Infirmary at Leeds Senior Surgical Tutor

Serum Treatment of Tetanus

The following case of tetanus in a young child, treated with massive doses of serum may be of interest. While it is fully realized that when the incubation period is longer than ten days the prognosis is good regardless of serum treatment yet there are one or two features about the case which may be of sufficient interest to merit its publication. The diagnosis in this case is in no doubt but the incubation period is unfortunately unknown.

CASE RECORD

A boy aged 2 years and 10 months who lived on a pig farm was brought to the out patient department on November 4, 1936 because for the past twenty four hours he had been able to open his mouth only partially. No cause could be

found for this. There was no history of trauma or of previous illness apart from measles in 1935. When seen the following day his condition was about the same but after his return home he suddenly had an attack lasting two or three minutes in which the teeth were clenched on the tongue, the head was retracted and the arms and legs became extended and rigid. On November 6 he had two similar attacks and he was admitted to the hospital shortly afterwards.

On admission the child showed the typical risus sardonicus. The masseters were in spasm and the mouth could not be opened actively or passively. The head was somewhat retracted and the neck muscles felt very rigid. The knees were spastic but all the other joints were quite free. All reflexes were brisk. The fundi were normal. The temperature was 98.8° and the pulse rate was 112. Tetanus having been diagnosed careful search was made for the initial lesion. The only abrasion found was a small scratch on the left cheek which was imperfectly healed and appeared to contain some dirt. The parents stated that it had been present about two months and had persistently refused to heal.

Anti-tetanic serum was given as follows: November 6 5000 units intravenously, 7 15000 units intravenously 5000 units intramuscularly and 20000 units intrathecally 8 25000 units intravenously and 15000 units intramuscularly 9 20000 units intravenously 10 20000 units intramuscularly 11 20000 units intravenously 12 20000 units intramuscularly 13, 20000 units intravenously and 16 20000 units intramuscularly. The total doses were intravenous 105000 units intramuscular 80000 units intrathecal 20000 units the whole amounting to 205000 units. The cerebrospinal fluid obtained on November 7 showed no abnormality. The serum caused no constitutional disturbance apart from a slight rash on one occasion. The lesion on the face was treated by scraping followed by application of picric acid. Chloral and bromide were given as required at first, and later regularly every four hours. On several occasions the tongue became caught between the teeth and had to be released by administration of chloroform. Three days after admission when attacks were occurring very frequently 1.2 ccm of avertin was given with very good effect.

As these attacks became less frequent the condition of the mouth and lungs gave cause for great anxiety. The mouth became extremely septic and there were marked signs of pulmonary congestion. The mouth was cleaned on each occasion when an anaesthetic was given and soon became normal when the child was able to take solid food. The pulmonary signs which were treated by the exhibition of atropine cleared up very satisfactorily. By November 21 the child could open his mouth and put his tongue out but the neck rigidity did not disappear completely until the beginning of December by which time recovery was complete. He was discharged on December 11. He attended a hospital children's party after Christmas and was observed to be in excellent health. The lesion on the cheek had healed completely leaving practically no scar.

Apart from the fact of the child's recovery it is of interest to note that no untoward symptoms followed the therapeutic use of this large dosage of serum in a child of this age and weighing only 26 lb. and also that the employment of avertin was of great value.

I wish to thank Dr N. H. Watson under whose care the child was admitted and Dr Kenneth Tallerman who saw the case in consultation for their kind permission to publish this note and for the help and advice which they have given me.

Resident Medical Officer

Harrow and Wealdstone Hospital

The French Ministries of Public Health and Physical Education have addressed to the prefects in France a circular in which they are urged to do all in their power to aid the Société de Prophylaxie Sanitaire et Morale in its educational programme relative to the venereal diseases. The prefects are requested to bring their influence to bear on sporting clubs in order that their leaders may give their support to the society in question.

Reviews

BRIGHT ON BRIGHT'S DISEASE

Original Papers of Richard Bright on Renal Disease
Edited by A. Arnold Osman D.S.C., F.R.C.P. (Pp 172
illustrated 21s.) London H. Milford, Oxford University Press 1937

By reproducing the four original papers of Richard Bright, with their beautiful coloured plates of the naked-eye appearances of the affected kidneys, Dr Arnold Osman has piously rendered a useful service in making readily accessible these classical writings so long out of print. Further, this welcome volume supplements Sir William Hale-White's full account of Bright's life and works, which, originally published in the *Guy's Hospital Reports* for 1921, was partially reproduced there in July, 1927, at the time of the centenary celebration of the appearance of the first of Bright's two volumes of *Reports of Medical Cases* when the late Professor W. S. Thayer of Baltimore delivered on July 8 the address on 'Richard Bright the Man and the Physician'.

The four papers now presented to the reader date from 1927. In 1833 Bright gave the Goulstonian Lectures at the Royal College of Physicians of London, the part of the second lecture, devoted to kidney disease, being reproduced here. The other two articles appeared in the first volume of the *Guy's Hospital Reports* (1836), and gave the most comprehensive account of the disease which has so long borne his name.

In an appropriate appendix Dr Osman introduces a new feature—namely, an account of histological sections made from three kidneys of cases recorded in Bright's original series of cases. These kidneys, in the museum of the hospital had not been previously thus examined, and now though difficulties were encountered in staining specimens a century old the histological changes are described, just as some years ago the original cases of Hodgkin's disease were submitted to what may be called palaco-histological examination. It is said that in 1842 Bright and his pupil George Robinson examined kidneys by the microscope but never reported thereon. This is hardly surprising for it was long before thin sections were cut the preparation for microscopy consisting of teasing out the tissues.

EYE, EAR, NOSE, AND THROAT

The Practitioners Library of Medicine and Surgery
Vol 11 *Eye Ear Nose and Throat* (Pp 1153 illustrated. Sold only in sets, £2 10s per vol.) New York and London D. Appleton Century Co 1937

The 1936 Year Book of the Eye Ear Nose and Throat
Pp 632 87 figures 2.50 dollars or 10s 6d postage 6d.)
Chicago Year Book Publishers Inc London H. K. Lewis and Co 1936

The first of these two recent publications forms one of a series which is intended to present the whole of medicine and surgery in a manner suited to the needs of general practice. The associate editors for volume 11 are Dr Arthur M. Yudkin for ophthalmology and Dr Paul B. MacCready for oto-laryngology. Such a large number of contributors take part in the construction of the book that some lack of uniformity is to be expected and this applies with special force to the descriptions of operative technique. Some operations such as extirpation of the lachrymal sac are described and illustrated in great detail while others for which a practitioner is more likely to become responsible (for example

the ordinary mastoid operations) receive much less description and are not illustrated. There are also articles which are not likely to make much appeal to the general practitioner, such as those on the histopathology of the middle ear and the physiology of the internal ear, valuable as they would be in a book with comprehensive aims.

The first part is devoted to the eye, and provides in systematic fashion a full account of every subject for which the book is likely to be consulted. This part impresses itself as superior both in arrangement and content to the later parts and is admirably illustrated, with even distribution of the pictures. It is not possible to mention more than a few, but the chapters on diseases of the uveal tract by Gifford, the crystalline lens by Kirby, the retina by Yudkin, and glaucoma by Yudkin are particularly good, and this third of the book, which is well documented, might serve as a textbook of ophthalmology.

The second part is devoted to the ear. This consists rather of a number of interesting essays on subjects in which the various writers are experts than of a systematic account of diseases of the ear. All these chapters appear well arranged if the titles only are considered, but an examination of the contents shows overlapping and a want of recognition of relative importance. The complications of suppurative otitis by MacCready, for instance is a good but condensed account, lacking illustrations, and quite out of proportion in length to the detailed articles on academic and scientific subjects.

Part III deals with diseases of the nose, nasopharynx, and sinuses. There is again overlapping in the first two chapters on physiology, and the illustrations in the chapters on the accessory sinuses are old-fashioned. The most satisfactory chapter is on fractures of the nasal and malar bones by Kazanjian. Part IV is concerned with diseases of the pharynx. The chapter on the tonsils by MacCready gives a sufficient account, but it cannot escape comment that there are no proper illustrations of the operation of removing the tonsils by dissection. Part V deals briefly with diseases of the larynx, and includes an excellent short account of bronchoscopy by Clerf.

The supervising editor says in his preface that he has turned to the comparatively younger group of American investigators for the newer material, and that the volume is therefore not a rehash of pre-existing material found in the older textbooks. In the section on the eye the material is certainly presented in the form desired but in the remaining four sections young America displays on the whole, a remarkable adherence to traditional conservatism.

The 1936 issue of the *Year Book of the Eye Ear Nose and Throat* fully maintains the excellent standard already set up by the editors of this publication. In the first part concerned with the eye will be found abstracts of papers dealing with the technique of operations for cataract and glaucoma, with illustrations. There is also an account of interesting experimental researches on the production of papilloedema and of chemical and anatomical studies on the pathology and pathogenesis of choked disk. The papers on acute bilateral retrobulbar neuritis treated by operations on the sphenoidal sinus and on acetylcholine in tobacco amblyopia are of practical importance. Two of the longest abstracts are of a study of optic nerve atrophy in relation to pituitary tumour and of the diagnosis of brain tumour.

In the section on the ear there is a good abstract of a paper by Lund which is likely to become classical on the indications for labyrinthine operations showing the importance of a study of the cerebro-spinal fluid. There

is also an interesting paper on neoplasms of the middle ear from which it appears that five out of six patients treated in the manner recommended had no recurrence from two to more than four years. Tuberculosis of the ear has received attention, and also a paper by Lüscher describing otomicroscopy. A collection of papers on the fashionable subject of petrositis is also summarized and illustrated. There is also an account of an ingenious explanation of neuralgias and ear symptoms associated with distorted functions of the temporo-mandibular joint and how relief may be given. The curious observations of Guild on shortened bone conduction in old age are described by the editor as startling but logical.

There are abstracts also of a varied collection of papers on the nose, mouth, and throat, including also bronchoscopy and gastroscopy. Most of these papers contain little that is novel and are confirmatory of previous observation and methods. The paper by Madrnka and Bardet of Geneva on acute pulmonary tuberculosis following radiotherapy of pharyngolaryngeal cancer is an exception, and is of great importance, as the authors found that in 43 per cent of forty-two patients acute pulmonary tuberculosis proved fatal in two to three months.

There is a good index of subjects and another of authors. The compilation shows excellent judgement in selection and is an admirable book of reference.

X-RAY DIAGNOSIS

A Manual of Radiological Diagnosis for Students and General Practitioners. By Ivan C. C. Tchaperoff, M.A. M.D. D.M.R.E. (Pp. 256, 286 plates, 21s.) Cambridge: H. K. Liff and Sons, 1937.

A concise guide to the salient points in x-ray diagnosis has long been needed, and Dr Tchaperoff has set himself the difficult task of filling the gap. For this he is well equipped for he has the gift of orderliness, and ranges his material in a systematic way curtailing verbiage so that he covers the whole vast field in a book of only 250 pages that also include 280 illustrations. This in itself is no mean feat, but when we examine the material that is so compressed we find very little omitted that is of importance and many things included which we would hardly expect in so condensed a volume. Naturally when on debatable ground the author cannot find space for discussion of the relative merits of divergent views, and either omits these or steers a middle course.

In each system of the body he opens with a radiological survey and deals, in the case of the osseous system with generalized bone disease following with regional diseases. The section on bones is by far the most extensive occupying more than a half of the volume. This is as it should be for a book of this kind. The author covers the ground very adequately and the illustrations are well chosen. He could with advantage have devoted more space to the other sections but doubtless the publishers set a limit to the size of the book. Yet when we go over these sections we find that all the vital points are dealt with and that the illustrations are sufficient for the purpose.

The author does not pretend to originality in this volume but aims at systematizing the main diagnostic points and often includes little tables drawn up to contrast the differences of the appearances in diseases that are liable to be confused. Throughout he insists both by precept and example on the systematic and orderly examination of the radiographs. In fact this book reminds the reviewer of the days of his anatomy reading when bewildered by the mass of detail in the large

standard textbooks, he turned to the Pocket Gray with which the book now under notice has close affinities.

We are not familiar with the process used for reproduction of the many well-selected radiographic illustrations that are printed in the text, they are not so good as the best half-tone blocks and are sometimes lacking in gradation. They all however, show the points for which they are chosen, and considering the price of the volume it is an achievement on the part of the publishers to have been able to include so many. The book is well and attractively turned out, and is certain to find a ready sale for not only will it be the first string for those taking up the study of radiology but it will also be much used for reference by those who are not in close touch with the subject, particularly general practitioners who having little or no experience, are often faced with the interpretation of radiographs. We can heartily recommend this book.

MEDICAL INTERPRETATIONS FOR LAYMEN

Medicine and Mankind. Edited by Iago Galdston, M.D. (Pp. 217, 7s. 6d. net.) London and New York: D. Appleton Century Co. Inc. 1936.

This book is an anthology of lectures to the laity delivered at the New York Academy of Medicine edited by the secretary of that institution. Its object is to enable the public to see clearly the workings of the medical and scientific mind. A chapter of special interest deals with the contribution of the primitive Americans to medicine. The author states that certain Mongolian characteristics have been observed in the indigenous natives of Brazil, pointing to a migration from Asia across the Behring Straits. In both North and South America medical knowledge had reached a surprisingly high level before the advent of the white man. The North American Indians were familiar with obstetric forceps, dilatation of the cervix and methods of controlling post partum haemorrhage. Even contraceptive measures were occasionally employed. Among the Mayas, pre-Incas and Incas amputations were performed and artificial limbs were in use. They filled teeth and fitted dentures. In difficult labours they performed symphysiotomy and carried out Caesarean section long before Caesar was born. Cocaine was employed as an anaesthetic, quinine, cascara and red willow, the natural form of salicylic acid are derived from the Indian pharmacopoeia.

The final chapter on the mystery of death is contributed by Dr Alexis Carrel. Dr Carrel maintains that death has been the builder of civilization for through natural selection the strong and the intelligent persisted and the great races developed. Through the success of our battle against death the weak have become artificially the equals of the strong and civilized countries are encumbered with those who should be dead. As a result natural selection has been almost suppressed.

MACCALLUM'S PATHOLOGY

A Textbook of Pathology. By W. G. MacCallum. Sixth edition, revised. (Pp. 1,277, 697 figures, 42s. incl.) Philadelphia and London: W. B. Saunders Co. 1936.

Since its original appearance in 1916 this well-known textbook has been republished in a fresh edition at unvarying intervals of four years, a fact which itself indicates the sustained popularity of the work. It has always differed from other textbooks in the arrangement of the subject matter on an aetiological instead of a regional basis. This has an admirable effect in dealing with such diseases as tuberculosis and syphilis in which numerous organs may be involved by a process which is

of the same essential nature wherever it occurs, but in other directions the consequences are less fortunate. Diseases of which the cause is unknown must obviously present difficulties, and these are either allotted to isolated chapters as in the case of Hodgkin's disease, or forced into a doubtful category, thus rheumatic fever appears among the infections caused by filterable viruses, as indeed does scarlet fever a position with whose implications few will agree. A chapter on disturbances of mineral and pigment metabolism embraces such otherwise unrelated subjects as calcium metabolism, chlorosis, jaundice and pneumoconiosis. The last of these is scarcely a disturbance of metabolism and would appear to have a more appropriate place in Chapter XIX (Chemical Injuries). It must be added that silicosis is dismissed in five lines and asbestosis is not mentioned. The virtues of such arrangement are nevertheless largely a matter of opinion and what is more important is that the whole work is comprehensive, up to date and easily readable. The illustrations are profuse, and include many admirable photographs of well-chosen specimens. References to important original papers and other fuller works are given not at the end of each chapter, but after each section, sometimes of less than a page, an arrangement which should be found of great convenience.

Notes on Books

Le Artropatie Croniche by Dr GAETANO ZAPPALA, assisted by Professor Giuseppe Lazzaro, forms part of the *Pohlmanco* series of medico-surgical monographs and as such will be of interest both to the physician and the surgeon. Professor Cesare Antonucci, a leading surgeon of Rome who has written the preface, welcomes the appearance of this book, especially as monographs of this kind are rare in Italy and the practitioner and students are consequently driven to consult works by French, German, English and American authors. The book is divided into two unequal parts. The first, which is written by Dr Zappala, is of a general character, dealing with anatomy and physiology, focal infection, allergy, cerebral symptoms, haematology, radiology, and classification. The second part, which forms the bulk of the work, deals with infective arthropathies (Lazzaro), non-infective arthropathies (Zappala), medical treatment (Lazzaro), and surgical treatment including orthopaedic appliances (Zappala). An international bibliography of 221 references is appended. The book is published in Rome by Luigi Pozzi, price 25 lire.

We have received from Messrs Knoll Limited (61, Welbeck Street W1) a volume which they are issuing in celebration of the jubilee of their foundation. It is entitled *Essential and Commonplace Aspects of Heart Disease* and is written by Dr KARL FAHRENKAMM of Stuttgart who remarks: "My twenty years of collaboration with the Knoll works, twenty years of natural growth in the evolution of experimental pharmacology in its relation to internal medicine and to the special aims and tendencies of the Knoll laboratories have made it a pleasure to accept the task of writing a small volume recording my personal experiences of heart disease, heart patients and experimentally proved and pharmacologically established methods of treatment. The author provides a series of interesting comments on cardiac therapy and the volume constitutes an acceptable jubilee gift."

The work entitled *Moscow in the Making* by Sir E. D. SIMON, a former Lord Mayor of Manchester and Parliamentary Secretary to the Ministry of Health, Lady SIMON, formerly chairman of the Manchester Education Committee, Dr W. A. ROBSON, reader in administrative law in the University of London, and Professor J. JEWKES, who occupies the chair of social economics in the Univer-

sity of Edinburgh, contains much that will be of interest to medical readers, especially those interested in public health and social medicine. In the first place the Moscow Soviet has instructed its representatives to take great care of the health of toilers and their children to increase medical assistance to the population, especially in villages, by building new hospitals and improving existing ones to increase the supply of medicines, to insist on rendering more careful and attentive assistance to the patients and to raise the qualification of medical staffs. The Moscow public health department which employs no fewer than 40,000 men and women and controls all the hospitals and many of the clinics and sanatoria contains two kinds of staff organization—namely, a shop councillor, elected by the whole mass of workers, and an association of doctors in each hospital, to advise on matters of professional conduct, ethics, and medical practice. Reference should also be made to the recent decree making abortion much more difficult, the active measures taken to solve the housing problem, and the arrangement of summer camps for children in the country. The book is published by Longmans, Green and Co., at 7s. 6d.

Dr LESLIE J. HARRIS has now produced a second edition of *Vitamins in Theory and Practice* (Cambridge University Press, 8s. 6d.). In revising the text note has been taken of advances made during the year—for example, the chemical characterization of vitamin B₁, the isolation of vitamin E, and the recognition that vitamin B₁₂ is a complex consisting of at least three factors.

Preparations and Appliances

A NEW OPEN-TOP OXYGEN TENT

Dr HUGH GAINSBOROUGH, Mr J. ADDYMAN GARDNER and Miss RUTH MURRAY (Biochemical Department, St. George's Hospital) write: "The open top oxygen tent was introduced by Burgess Briggs and Burgess (1934) who constructed it in the form of a rigid box with windows. At the lower end of the box was an opening through which the patient's head could be introduced and a fabric collar was fitted round the patient's neck to make a 'gas tight' seal. The oxygen entered the apparatus through an ice-box suspended inside the tent and this box was covered with a metal shield to prevent cold air displacing the oxygen. The principle involved was that the introduction of cold oxygen at a suitable speed produced a concentration of this gas round the patient's head sufficient for all ordinary therapeutic purposes. A British-made tent constructed of rubberized fabric was described in the *British Medical Journal* of September 12, 1936 (p. 542). Now certain important modifications have been introduced which have improved both its efficiency and its applicability. The final design is considered satisfactory and by permission of the authorities concerned it is marketed under the name of the St. George's Hospital Oxygen Tent."

In the early pattern the presence of the ice box in the tent itself was a disadvantage. The cooling system now consists of an external box made of rustproof metal which is attached to the stand of the apparatus. Inside this there is a coil of metal tubing of adequate length and bore through which the oxygen passes. The box is filled with crushed ice and then with water to ensure adequate contact with the coil and under such conditions oxygen passing through at a rate of 7 litres a minute is cooled about 8°C. In unfavourable conditions during summer the cooler can be packed with alternate layers of crushed ice and common salt before filling with water and the temperature of the oxygen can be lowered to about 3°C. The oxygen is not humidified as we found that the humidity in the tent at the level of the patient's mouth varied between 80 and 95 per cent. Hygrometer readings in the tent are possibly not of much value as there is a diminishing gradient of humidity from the bottom to the top of the tent. The elastic collar round the

neck orifice of the original tent caused a good deal of discomfort and heating. The material is now cut amply round this orifice so that it can be folded loosely over the front of the patient's chest or tucked into the upper garment. The former method is quite adequate as a rule and allows the patient to use a handkerchief or a spittoon with surprisingly little disturbance of oxygen concentration. In use as soon as the tent has been placed in position over the patient's head oxygen is run in at the rate of 10 litres a minute for about ten minutes and the rate is then reduced to 7 litres a minute.

With this supply the oxygen concentration at the level of the patient's nose varies between 45 and 65 per cent. Under suitable conditions with absence of draughts a supply of oxygen at the rate of 5 litres a minute may be adequate to maintain the oxygen concentration at breathing level well over 50 per cent. The new tent has a very wide range of utility and we think it shows several advantages over other forms of apparatus for oxygen administration. There are no nursing difficulties, the hood can be sterilized easily, the apparatus is portable and easy to operate and finally with ordinary precautions there can be no risk of explosion.

SIMPLE GAS ANALYSIS APPARATUS FOR USE
WITH OXYGEN TENTS

Dr. HUGH GAINSBOROUGH and Mr. J. ADDYMAN GARDNER (Biochemical Department, St. George's Hospital) write: This apparatus was designed to provide a simple rapid method of estimating the carbon dioxide and oxygen contents in oxygen tents. It consists of a glass bulb of cylindrical shape with a lower narrow portion (Fig. 1). The ends are capillary tubing closed by simple one-way taps. The volume between the taps is 10 c.c.m. and the volume of the narrow section is about 1 c.c.m. The whole of the bulb is graduated into 100 equal divisions by volume. It is used as follows. The apparatus (Fig. 1) is connected by fine rubber tubing to the tent or to a capillary glass tube the distal end of which can be placed at any desired point in the tent and the other end to a small reservoir of water (A). The taps are both turned to the through position, the clip on the reservoir tubing is opened and by lifting the reservoir up and down three times the apparatus is filled with a true local sample of the tent atmosphere. On lowering the reservoir for the last time the water in the

bulb is allowed to descend till it just reaches the top of the lower tap which is then closed. The top tap is closed next and the apparatus disconnected at both ends. It is important that the bulb itself should not be grasped in the hand since the gas should be at the temperature of the water in the reservoir. The next stage is to force the absorbing solution into the analyser by means of the Woulfe bottles and rubber bulbs. The plain stopper is taken out of the bottle which contains 40 per cent. potash and the apparatus inserted into that same neck till the rubber stopper on its lower end is firmly fixed. The lower tap is then opened and by compressing the rubber bulb about 1 to 2 c.c.m. of solution is forced into the analyser and the lower tap quickly turned. The apparatus is removed from the Woulfe bottle, the lower end rinsed with water and it is then placed horizontally and rotated gently for one minute. It is next immersed upright in the cylinder of water B and allowed to stand to reach the temperature of the water. It is then lifted till the lower tap can be opened and the tube is adjusted until the fluid level inside is the same as outside when the lower tap can be again closed and a reading taken which gives directly the percentage of carbon dioxide. The apparatus is then connected as before to the Woulfe bottle which contains alkaline pyrogallol solution and about 2 c.c.m. of this is forced into it by the use of the compressor bulb. The tap is again closed, the apparatus removed, the lower end rinsed carefully without dropping any of the very corrosive alkali pyrogallol solution and then rotated as before for three to four minutes in a horizontal position. It is then reinserted in the glass cylinder and the degree of absorption measured indicates the oxygen content. Care should be taken to close the Woulfe bottles immediately after use. The apparatus must be carefully cleaned. This is easily done if a small piece of rubber tube is put on the top capillary and the apparatus held under a thin stream of running water from the tap. After washing with tap water this can be blown out, the apparatus filled with 5 per cent. sulphuric acid, emptied and finally washed out with distilled water. The alkaline pyrogallol solution is prepared by dissolving

FIG. 1

FIG. 2

10 grammes of pyrogallol acid in 100 c.c.m. of 80 per cent. potash. This solution must be stored in a very carefully stoppered bottle and exposed to the air as little as possible. For the sake of convenience and in order to avoid any risk of damage to table or shelf top by the alkali solutions used the analyser is supplied by the makers complete with all necessary accessory apparatus mounted on a suitable tray.

TUBERCULIN-TESTED MILK

No one who has taken the trouble to ascertain the facts is under any delusion about the unsatisfactory quality of the nation's milk supply. It has been aptly compared by Sir John Orr to that of our water supplies of a hundred years ago. How is this position to be remedied? In a well-informed and closely reasoned report¹ issued from the Agricultural Economics Research Institute of Oxford Mr R. N. Dixey attempts to answer this question. The choice for him lies between the production of milk from tuberculin tested herds and compulsory pasteurization. Against the latter course he brings a number of arguments, the most important of which is that, in order to afford a completely effective safeguard against milk-borne disease pasteurization has to be carried out with a standard of exactitude more resembling that met with in a laboratory than in a commercial plant. His leaning is strongly towards the alternative course of producing tuberculin-tested milk. The difficulties, however, in the way of this choice are very considerable, and the body of his report deals with an examination of the practical measures involved. First of all, it is pointed out that not all milk need come from tuberculin-tested herds. Milk for cooking and for most manufacturing purposes could quite well be used in the infected condition. The supply of milk and cream for consumption in the liquid state, including that for butter and soft cheese production, could probably be assured if about two-thirds of the gallonage was derived from herds free from tuberculosis. Secondly, an attempt is made to ascertain the cost of establishing a tuberculin-tested herd. Inquiries conducted on 180 farms producing tuberculin tested milk showed that the average cost was about £13 per cow. Of this £7 were for structural alterations £2 to £3 for milking equipment and £3 to £4 for the replacement of reacting by non-reacting cows. Not all of this expenditure could strictly be assigned to the elimination and avoidance of tuberculous infection; some of it was rendered necessary for the production of clean milk. Broadly speaking however an additional cost of £13 per cow may be accepted as

a provisional estimate, subject, of course, on different farms, to wide variations, for the production of tuberculin-tested milk. If two-thirds of the milk supply was to be of this type an immediate expenditure of 13½ million pounds would be required. This is regarded as by no means an excessive figure, "and if the benefits to public health would justify the Government in advancing all, or part of this cost the present period of cheap money clearly offers as good an opportunity as has occurred for many years." His final conclusion is that the greatest hope for increasing consumption lies in providing the public with "safe, clean milk as it comes fresh from healthy cows."

Mr Dixey's thesis is put forward in far too serious a manner to be lightly criticized. It is impossible, however to avoid pointing out a fallacy in his major premise—namely that milk from tuberculin tested cows is safe. So it is safe from the risk of causing tuberculosis but not from the risk of carrying a number of other different infections. The experience of the United States of Denmark, and of this country during the past few years has provided evidence, cumulative and convincing, that milk produced under the most careful sanitary conditions may yet be responsible for spreading scarlet fever, septic sore throat, diphtheria, typhoid fever, paratyphoid fever, dysentery, food poisoning, and undulant fever, often in a serious and extensive epidemic form. Tuberculosis is not the only disease borne by milk, and even if all the milk in the country was derived from tuberculin tested herds it would still be desirable for the protection of the public to submit it to efficient pasteurization or other form of heat treatment. By all means let us have milk from tuberculin tested, abortus tested, and mastitis free cows, but let us, in addition, protect ourselves by pasteurization against the danger of its contamination from human and other sources.

There is a fundamental divergence of outlook between public health workers on the one hand and agricultural and veterinary workers on the other, due to a confusion of the main issue. Hitherto the production of clean milk and the control of disease in the herds has rested very largely with the Ministry of Health and local health authorities and both have been made contingent on the demand by the public for high-grade milk. This demand has not in fact been forthcoming except to a quite trivial degree and in consequence comparatively little progress has been made in the eradication of disease among the cattle population. If progress is to be made it is important as the Reorganization Commission² points out to eradicate disease for

¹ Dixey, R. N. *Tuberculin Tested Milk. A Study of Reorganization for its Production.* Agricultural Economics Research Institute Oxford 1937.

² *British Medical Journal* January 2, 1937 p. 23

its own sake, and not to make it dependent on the payment of a higher price by the public for milk derived from disease-free herds. The production of clean milk and the eradication of disease are problems for the agriculturist and the veterinarian, and we are wholly in agreement with Mr. Dixey that the Government ought to advance the money to clean up herds and improve the quality of the milk supply. On the other hand, the distribution of milk is essentially a problem for the public health authorities and if they refuse to take the responsibility of distributing raw milk to the population and insist on rendering it safe by pasteurization, then it is really no concern of our agricultural and veterinary colleagues. No antagonism exists, or ought to exist, between pasteurization on the one hand and the production of clean milk and the eradication of disease from the herds on the other. This is borne out by experience in the United States where a high proportion of milk from tuberculin tested herds is pasteurized in the large cities. The two problems are distinct. Sooner or later we shall be forced to take the control of milk production out of the hands of the public health authorities and transfer it completely to our agricultural and veterinary colleagues, to whom it rightly belongs. If they are wise they will press for adequate subsidies to convert our disease-riddled cattle population into one that is more worthy of a country which prides itself on its care of the lower animals. The public health authorities will then be left with the control of the consumption end and they will be able to devote a great deal of their energy to tightening up the supervision of pasteurizing plants and ensuring, so far as possible, that all milk delivered to the public, at any rate in urban districts, shall be as safe as our large filtered and chlorinated municipal water supplies.

"A HOUSE WORTH LIVING IN"

Some years ago Dr. K. Henderson made an interesting quotation from the report of Gartnavel Asylum for the year 1816. The case is there recorded of an old dragoon who, every three months, had a dreadful attack of outrageous insanity. Gradually, however, he improved and it is recorded that he became 'very happy knitting worsted gloves until a proper place of residence was found for him'. In the same report it is stated: "Two looms have been erected by the superintendent which made one patient who had been for some years listless almost to torpor exclaim that the house was now altered indeed; it was now worth living in. Anything we can

here say about occupational therapy can really be no more than an elaboration of this impressive human paragraph written by an enlightened psychiatrist over a century ago. The seeds sown by the enterprising doctor of the past would indeed rejoice him if he could but see the fruits of his labours. Nowadays no mental hospital could be regarded as 'efficiently organized' if occupational treatment did not form part of the daily routine. How far this treatment has developed is exemplified in a book on recreational therapy for the mentally ill written in the United States by Mr. John Eisele Davis and Dr. William Rush Dunton.¹ In a foreword Dr. Adolph Meyer observes that the best form of treatment is the removal of the cause. The best help in readjustment is the use of those parts of the patient's make-up which work well, so as to give the most normal setting for what needs readjustment. This naturally demands resourcefulness and actual experience of an unusual type—the what to do and the how—and a collaboration between the organizer of activity and the physician and the patient.

Recreational therapy has a deeper, more significant and extensive contribution than this which can only be attained through the natural and pleasurable social unfolding of the psychotic patient. Desirable social readjustment, higher levels of social striving and worthwhile social accomplishment may well supply some of the objectives. Recreational therapy should operate as an adjuvant to which many social sciences may bring distinctive contributions. The aim should be to recreate the spirit through many stimulating and tonic effects of interest inherent in the multifarious activities which this therapy provides to increase the strength of positive volitional responses to social reorientation and to assist in healthful emotional expression and emotional release which will provide the balance and effective stimulation for constructive effort. Such a programme of recreational activities for patients with mental disorder must be comprehensive and highly diversified and may well take in such seemingly unrelated pursuits as playing Mendelssohn's 'Spring Song' or participation in an informal circus.

It is evident that the spirit of occupational treatment permeates the psychiatric clinics in America. Many patients may not be well enough to leave the sanatorium but it is evident that everything is done to make them happy and busy with all kinds of occupation. They can at least say truthfully that 'the house is well worth living in'.

Principles and Practice of Recreational Therapy for the Mentally Ill. By John Eisele Davis, M.A. in collaboration with Dr. W. Rush Dunton, jun. London: V. Heinemann (1935).

MORE ABOUT VIRUS DISEASES

How profoundly filterable viruses differ from bacteria is only understood by those who take a more than ordinary interest in microbiology. It is not even certain that some of them are living entities. They are demonstrably particulate but some are so small that the simplest organization necessary for biological activities is almost inconceivable in such a compass. To call the virus of the Rous sarcoma a "transmissible mutagen" did not carry matters much farther but it was an ingenious expression implying a belief that here was something of a nature fundamentally new. That the immunology of virus diseases also differs from that of bacterial infections and that the multiplication of viruses appears only to occur within living cells are other fundamental points of distinction. In this sphere so much is known yet so much is still unknown, that to take stock occasionally and to speculate within reasonable limits is helpful. Two recent papers on these lines are well worthy of study. Goodpasture¹ reviews the phenomena of immunity in virus diseases laying particular stress on an aspect which has only been fully appreciated within recent years—namely the purely intracellular habitat and activities of viruses and their entire insusceptibility once established there to the influence of humoral antibodies. Antiviral serum is a magnificent prophylactic but worthless therapeutically for this reason. Goodpasture regards it as an axiom that killed virus cannot immunize and suggests as an explanation for this that an immunizing antigen is produced only during actual infection. On a much larger scale than this paper is Findlay's² review on variation in animal viruses: its scope may be gathered from the fact that it ends with a bibliography extending to fifteen pages. The argument here is that variants develop in viruses as they do among bacteria and for the same reasons such as habituation to another species with similar changes in antigenic constitution and in pathogenicity thus viruses behave as other living entities. This is a weighty argument, capable of and receiving profuse illustration. It is perhaps more impressive when it deals with the phenomena of actual disease. Serological methods seem sometimes to be carrying a greater weight in connexion with virus diseases than true comprehension of their mechanism and meaning can bear. A short account has also just been published of some observations which bear on one interesting aspect of immunity to virus diseases. It is well known that most adults and older children have neutralizing antibody for poliomyelitis virus in their blood and are consequently immune to this disease. It is by no means certain whether this immunity is acquired by a symptomless infection or produced in some other way. If the latter other virus infections might conceivably protect against poliomyelitis and evidence was forthcoming some years ago that vaccinia has this effect the incidence of poliomyelitis in vaccinated children being found considerably less than in unvaccinated. Dalldorf, Douglass and Robinson³ now report that in monkeys suffering or

recently recovered from experimental distemper inoculation with a poliomyelitis virus which is invariably fatal in control animals causes a mortality of only 33 per cent. The meaning of this result is not discussed, but one possibility at least appears to be that there is some antigenic relation between the two viruses. In view of the difficulties and dangers of attempted active immunization against poliomyelitis the possibility perhaps foreshadowed in this observation, of securing protection by non-specific means would be very welcome.

HYPOCHONDRIASIS

Hypochondriasis or the "bodily complaint," has troubled physicians ever since medicine began. The hypochondria, the regions below the costal cartilages were considered to be the seat of the black bile which caused melancholy and Robert Burton in his *Anatomy of Melancholy* shows a psychological insight into the condition which was much in advance of his time. Among its causes he numbers frustrated ambitions, disappointed love and solitariness, and in addition to physical treatment he recommends confession, spiritual discipline, distraction, music, mirth and merry company. Mandeville describes a common approach of the hypochondriac to his physician: "I have sent for you doctor, to consult you about a distemper of which I am well assured I shall never be cured." Dr. Felix Brown⁴ has studied the records of 226 patients admitted to the Phipps Clinic in 1934 and examined in more detail forty-one cases of hypochondriasis. The incidence he found to be 45 per cent. of the total admissions, more or less equally divided between the sexes. The bodily symptoms showed the widest variety. His attitude towards the disease is one which in earlier days was stressed more by lay than by medical writers, as he shows in a rich historical survey. He calls it a reaction of the individual to a life difficulty rather than a disease and classifies his forty-one cases roughly into five categories of bodily complaints. First come those which are partly on a physiological level and usually associated with anxieties—those which have appeared by substitution or conversion of an affect usually anxiety with more or less elimination of the affect—and those which have some more or less conscious purpose. These three types he says merge into one another and may be variously mixed in the mercurial or psychoneurotic reactions. His fourth and fifth types are bodily complaints symbolic of an essential conflict of the personality and bodily complaints consistent with a mood disturbance usually depression. The method of treatment he recommends is that of distributive analysis: the physician actively distributes the analysis along the lines which seem most pertinent and makes some synthesis or constructive formulation at the end of every interview. No special search is made for a single factor, such as a sexual trauma in early childhood; definite advice is seldom given but the alternatives are put before the patient and explained and he is allowed to make his choice. He is encouraged thoroughly to help himself. In every case a complete history is taken and

³ *Science* 1937 85 184

⁴ *J. ment. Sci.* 1936 82 295

a psychiatric examination made in suitable cases a Binet-Simon test is performed. Free association and hypnosis are sometimes used. If the patient is admitted to hospital he enters a regular routine of occupational therapy and physical exercise and has to adjust himself to his own group of about thirteen other patients, any topical difficulties being freely discussed and analysed. An immense change says Dr Felix Brown can often be brought about by re-education and discipline, and by putting the patient where the hypochondriacal reaction will not work. Rest in bed forms no part of the treatment of the patient with a psychogenic body complaint. In the words of Sir William Gull 'if the patient thinks that the doctor is taking pains to get at the secret of his troubles he will be inclined to accept the first word of encouragement the latter throws out, and the reflecting influence of reviving hope will be certain to assist recovery.'

ACTION OF ASPHYXIATING WAR GASES

Those war 'gases' commonly referred to as asphyxiating such as chlorine phosgene di-phosgene and chlorpicrin must be distinguished from the true asphyxiants such as nitrogen methane etc. which act simply by displacing oxygen and from those such as carbon monoxide and hydrocyanic acid which disturb the transport and utilization of oxygen in the organism. The war 'gases' (gases or liquids) referred to are better named lung irritants. The mechanism of action of the best known of these depends on the chlorine content: thus phosgene (COCl_2) is held to be hydrolysed by the water in the lung tissue with liberation of free HCl and CO the irritant action resulting from the local effects of the acid. This simple view has been challenged notably by A. Kling.¹ From a consideration of certain properties of the lung irritants—for example their strong affinity for the hydroxyl group and their ease of hydrolysis—he is impressed by the disproportion between the small amount of irritant, which is effective and the overwhelmingly greater size and weight of the affected organ. He also lays stress on the solubility of these irritants in lipoids and is led to the view that there is some underlying element in the lung parenchyma which makes possible the action of all these lung irritants. He therefore puts forward the suggestion that cholesterol (unsaturated complex alcohol) may be the common body which by combining with the irritant gas undergoes such modification of its physico-chemical properties as to produce the characteristic functional changes in the lung parenchyma. To test this hypothesis Kling and his fellow workers first attempted to prepare compounds of phosgene (and some of its derivatives) and cholesterol. Such compounds could be prepared and their synthesis formulated and it is interesting to note that the derivative of phosgene which is hardly irritant at all—namely methyl monochlorformate—does not give a cholesterol ester. When however this derivative of phosgene was further chlorinated and thus made very irritant it gave cholesterol esters readily. It appears therefore that there is some parallelism between the power to produce

injury to the lung and that to form cholesterol esters. The hydrolysis of these esters was studied in detail. The products of hydrolysis depend of course upon the particular gas used for the ester formation and include carbonic acid (in all cases) hydrochloric acid formaldehyde carbon monoxide and the original alcohol (in all cases). The particular ester studied could be distinguished by the ratio in the hydrolysate of CO to inorganic chlorine: thus when phosgene is used this ratio is 1, with monochloromethyl-chlorformate it is also 1, but when the higher chlorinated trichloromethyl-chlorformate the ratio is 1/2, and so on. The next step was to extract the lipoids from the lungs of various animals and to demonstrate that similar esters to the above could be prepared with the irritant gases. The formation of esters could likewise be shown when using pulped lungs from various animals. A good case was therefore made for the formation of lipid esters in lung lipoids under the influence of at any rate, the phosgene series of gases. More difficulty was experienced in demonstrating this in the lungs of anaesthetized dogs which had been submitted to the action of these gases. But if massive doses were administered to large animals it was possible to demonstrate that the free cholesterol in the lungs was diminished by 20 per cent—that is 20 per cent was esterified. Further evidence will be necessary before this hypothesis can be accepted, but the case has been presented in a plausible manner if not yet in an entirely convincing one. If it can be proved that demonstrable physico-chemical changes in the lipoids are causally related to acute oedema of the lungs a contribution will have been made to the pathology of this condition.

THE PUBLIC HEALTH ACT, 1936

When new Acts of Parliament reach the Statute Book it is customary for publishers to issue them in book form with explanations annotations and cross references. As a rule such books have been of limited value probably because the laborious research into the history of the law and its judicial interpretation necessary to make them really useful would have occupied more time than the compiler was allowed for his task. The Act of 1936 is in a different category. When it was first issued in draft form it was accompanied by an explanatory report the Second Interim Report of the Local Government and Public Health Consolidation Committee which is in itself an essay on public health law and includes detailed descriptions of most of the changes which the Act now embodies. The work of interpretation is thus facilitated and Mr David Beattie's recent book¹ is an example of the benefits of the procedure for consolidation followed in recent times. It opens with a general introduction describing the process by which the Bill reached Parliament and was handled by it and referring to the nature of the major amendments contained in the Act. Each of the twelve parts of the Act is introduced by a brief explanatory note special reference being made to any outstanding change in the law contained in that part. The sections then

¹ *Bull. Acad. Med. Paris* 1936 116 465

The Public Health Act 1936. By David J. Beattie. L.L.M. London: The Solicitors' Law Stationery Society (1936)

selves are amply annotated. The usual tables of cases and of statutes are included and useful tables are also introduced relating the sections of the Act to those of previous general Acts. The book is fully indexed and excellently printed and produced. A careful examination has failed to reveal any errors or important omissions. This publication should therefore be useful even to those who possess the Report of the Consolidation Committee and the subsequent circulars of the Ministry dealing with the Act.

DR ROUTLEY'S VISIT

Dr T C Routley, General Secretary of the Canadian Medical Association is now on a visit to this country to make a first hand study of the problem of National Health Insurance and the inside working of the Act. His itinerary in Great Britain has been planned at the headquarters of the British Medical Association. On April 8 Dr and Mrs Routley were entertained at luncheon at Grosvenor House by the chief officers and officials. Among those present to meet the guests were the President Sir Farquhar Buzzard, the Treasurer and Mrs Bishop Harman, Sir Humphry Rolleston, Sir Henry Brackenbury, Dr Robert Hutchison, and Dr C O. Hawthorne. As the Chairman of Council, Sir Kaye Le Fleming remarked in his short speech of welcome the occasion was an informal one. He would like he said to take this opportunity of acknowledging the generous hospitality which members of the British Medical Association had received on the other side of the Atlantic. He recalled with pleasure his meeting with Dr Routley in 1932 when the Association commemorated its centenary year by a pilgrimage to Worcester. Dr Routley had come over here to study the important problem of National Health Insurance. Although he Sir Kaye did not know fully the attitude of Canada to this problem it was quite clear to him that the USA had a lack of understanding of the matter. He therefore wished Dr Routley every success in his mission and would point out that, although the methods of conducting National Health Insurance in this country could not necessarily be applied in detail in Canada the principles laid down for its conduct were essential for success. It had he concluded been a source of regret to him that the links between the British Medical Association and the Canadian Medical Association were not of a more practical nature considering how strong were the sentimental ties that bound these two organizations.

In an apt and gracious speech Dr Routley expressed his appreciation of the reception given to him and to Mrs Routley and of the facilities offered him for carrying out the investigation he was making on behalf of the Canadian Medical Association. "We come to you" he said "at a time in the history of our country when levelling influences are needed." Although Canada physically was a great country the Canadian Medical Association was small. Illustrating this remark with a pleasant story about the Canadian Pacific Railway Dr Routley remarked that he came here with an application to "travel over your line." It had been a privilege to him to attend the meeting of the Council of the British

Medical Association on April 7, and he was much impressed by the care and the work that lay behind the presentation of the reports of the various committees and by the statesman-like way in which the business of the Council was handled. National Health Insurance was a live issue in Canada but the various proposals on foot had not yet been implemented by legislative enactment. In view of the importance of this question it was strange that Canada had waited twenty five years before sending an official medical emissary to Great Britain and more than strange that the USA had sent no emissary at all. There were he said strong reasons why the Canadian Medical Association and the British Medical Association should get together in closer and more practical co operation. Although he could offer no detailed plan to make this effective, he suggested that a committee might be set up on each side for the purpose of interchanging ideas and discussing common problems. At the coming meeting of the Canadian Medical Association at Ottawa a great welcome awaited the representatives of the British Medical Association and their visit was looked forward to with keen interest and pleasure. Finally, Dr Routley conveyed to the British Medical Association the good wishes of medical men in Canada, and said that not least among their possessions was pride at belonging to the British Commonwealth of Nations.

"HISTORADIOGRAPHY"

X rays lack one property that is possessed by visible light that of being refracted by an optical system. It is true that they can be refracted by crystal planes a property made use of in x-ray spectroscopy but this does not make it possible to focus them optically in a camera or a microscope. In the study of histological sections by radiography therefore the magnification of the picture must take place by enlargement of the finished film and not during the exposure as in the photomicrograph. P Lamarque¹ has elaborated an ingenious method which he has termed "historadiography" by which he obtains radio photomicrographs of histological sections. He uses a special x ray tube energized with a voltage of only 5 kilovolts. The resulting x-ray beam is absorbed by air to avoid this effect the histological section is gummed to a sensitive photographic film and placed in a vacuum chamber attached to the tube. The x-ray exposure made the sensitive photographic film is then developed and viewed under the microscope in the ordinary way. Photomicrographs may of course be taken of the section for purposes of reproduction. An essential feature of the method is the sensitive film which at present Lamarque makes himself. The ordinary x ray or photographic film is too coarsely grained to allow much in the way of magnification. Enough work has already been done to prove that it is no mere duplicate of the standard colour method but that it may reveal histological features not shown by ordinary staining methods and that it is really complementary to them. When the technique is perfected a considerable new field of research will be opened up and one that may yield important results.

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

THE MENOPAUSE

By

P M F BISHOP, B.M., B.Ch.

The menopause is a period of variable duration through which women pass naturally some time between the ages of 45 and 55. For about 15 per cent of women it is symptomless; in the remainder the severity of the symptoms varies; they may be so mild as to render treatment unnecessary or so severe as to lead to profound mental disturbances. Surgical removal of the ovaries in younger women or destruction of ovarian function by deep x rays or radium brings about an artificial menopause which is usually attended by similar but relatively more severe symptoms.

The great variety of changes which may take place can be grouped conveniently under the following headings:

Vasomotor Changes

The tendency to vasomotor instability is shown by the most characteristic menopausal manifestation—hot flushes. In these attacks dilatation of the vessels of the skin is accompanied by sweating and discomfort due to a sensation of heat and suffocation, which after a few minutes gives way to cold shivers. The hot flush is painfully obvious to those around the patient and consequently causes her some embarrassment. Flushes may appear without warning at any time of day or night, frequently awakening the patient, but they are especially prone to follow circumstances giving rise to emotional stress or excitement. Their frequency varies greatly in different patients, and they may occur only once or twice a week or twenty or thirty times a day.

Cardiovascular Symptoms

Though no organic cardiac lesion is associated with the menopause, symptoms such as palpitations and precordial pain may be experienced. The blood pressure is sometimes found to be raised and it has been suggested on inadequate experimental grounds, that this may be due to the excessive activity of the anterior pituitary basophil cells or of the adrenal cortex. Ovarian deficiency, both in earlier life and at the time of the menopause, is often associated with acrocyanosis and in some cases ovarian replacement therapy has led to improvement in the circulation to the extremities.

Arthritis

Pains in the joints, backache and fibrositis are all common complaints and a menopausal type of arthritis is described which is due to chronic hypertrophic synovitis and usually affects the knees.

Emotional Instability

Practically every menopausal woman becomes aware of a certain mental clumsiness, an inability to cope with the ordinary problems of daily life and a tendency to give in. The realization of her shortcomings is worrying and she readily becomes depressed. Emotional instability is well defined and the patient reacts to trivial situations with rather surprising attacks of laughter or

tears. She is subject to rapid and frequent changes of mood; at one moment she will be unbearably irritable, at the next pathetically contrite. There may be marked changes in personality and severe attacks of mental depression sometimes lasting for days during which the patient may become suicidal. A condition of hypochondriasis, which is particularly distressing to those around her, may develop out of the complicated syndrome even in the milder cases and persist for the remainder of the patient's life.

Headaches and giddiness are common and appear early. Migraine is frequently aggravated or induced, but is sometimes amenable to treatment with ovarian extracts.

Endocrine Changes

Owing to the delicate interdependence of the components of the endocrine system the functional failure of one gland is likely to affect all the others. A common example is the gradual masculinization which may take place. The breasts atrophy, hair appears on the chin and upper lip and the features assume a male appearance. This virilism is probably due to a compensatory overactivity of the adrenal cortex. Thyroid function frequently diminishes and signs of hypothyroidism are common. Skeletal changes suggestive of acromegaly may occur and provide evidence of the disturbance of pituitary secretion. There are some who believe that the obesity which commonly develops is endocrine in origin and remark on the 'girdle' type of distribution, which suggests that the pituitary may be responsible.

The essential feature of the syndrome is of course amenorrhoea which may appear quite suddenly or after some months of menstrual irregularity. Other characteristics of the gradual ovarian failure are the atrophy of the breasts, uterus, and external genitalia. Sexual desire usually wanes, particularly when the menopause has been surgically induced, but may remain unchanged.

Methods of Treatment

General.—Assistance can be rendered by the members of the patient's household. Her husband and her relatives should be told that she is passing through a difficult phase of life and that they should therefore be tolerant and sympathetic in their dealings with her. She should be shielded as much as possible from domestic worries, and sometimes a holiday away from her household duties is beneficial, though it may be harmful if she is a woman of forceful personality who will worry over the conduct of her home in her absence. She should be encouraged to pursue any hobby which will prevent her from becoming introspective about her condition. She may suffer from a secret fear that her symptoms are due to cancer and it is wise for her doctor to reassure her specifically on this point. Bromides and valerian are popular and sometimes efficacious. Thyroid extract is of value only in those cases in which there is clinical evidence of hypothyroidism.

Pituitary Extracts.—There is an increasing tendency to prescribe anterior pituitary preparations. This form of therapy is based on a misunderstanding of the endocrinology of the condition. The relative activity of the ovary and pituitary is complementary, so that when ovaries

function is declining the gonadotropic activity of the anterior pituitary is excessive. That there is no deficiency of pituitary secretion at the time of the menopause is shown by the increased concentration of the follicle stimulating factor in the urine. Furthermore, it has been pointed out that the severity of the symptoms—for example the number of hot flushes a day—runs parallel with the curve of urinary excretion of the follicle-stimulating factor. Nor does there appear to be a reasonable basis for attempting to control the uterine haemorrhages which sometimes occur during the early stages of the menopause with gonadotropic preparations. These are designed theoretically to stimulate ovarian function, whereas the failure of ovarian function at the menopause is progressive and inevitable so that any attempt at artificial stimulation merely exemplifies the unsound principle of flogging the tired horse. It is, moreover, fashionable to administer anterior pituitary preparations by mouth. For this there is no experimental justification. All animal experiments so far conducted on these substances have failed to show any effect if the material is administered in any other way than by injection. A few encouraging results of irradiation of the pituitary with the object of diminishing its gonadotropic activity have been reported, but in the majority of cases this seems an unnecessarily drastic procedure.

Ovarian Extracts—By far the most satisfactory method of controlling the symptoms of the menopause is by the administration of oestrogenic preparations. This method of treatment produces results probably by temporarily restoring the endocrine balance until the patient has accustomed herself to the new level of endocrine activity. The ovarian extract acts both by replacing the ovarian deficiency to some extent and by damping down the excessive activity of the pituitary.

Principles of Treatment with Oestrin

Urinary Estimations—It has already been pointed out that owing to the compensatory overactivity of the pituitary an excess of the follicle stimulating factor can be demonstrated in the urine. Quantitative estimations of this principle are however laborious, expensive, and subject to a considerable margin of technical error. It is hoped that in the near future such estimations will be placed on a more practical basis but at the present they are merely of rather doubtful academic interest.

Vaginal Smears—The use of the vaginal smear technique of Papanicolaou and Shorr has proved to be of greater value. As the result of deprivation of oestrin the vaginal mucosa undergoes atrophy and the appearance of the menopausal vaginal smear is quite characteristic. By the examination of such a smear therefore, it is possible to identify those cases in which the symptoms are associated with ovarian deficiency. In the first group oestrin therapy usually produces satisfactory results, in the second group it is without effect. Furthermore it is fortunate that the human vagina is a delicate indicator of oestrogenic influence for one is enabled to estimate the correct dose of ovarian extract for each individual patient by determining the amount necessary to induce an oestrous type of smear. This applies only to the more common and milder symptoms which are gradually coming under control by the time an oestrous smear has been produced. This is of importance, for the object of the treatment is not completely to replace the ovarian activity of pre-climacteric life nor entirely to counteract the excessive activity of the pituitary but to accustom the patient gradually to the new level of endocrine balance.

The Psychological Factor—A preliminary course should be given exactly resembling the intended regime of oestrin therapy with regard to mode of administration—whether by mouth or by injection, colour of the tablets, appearance of the solution for injection, etc.—but differing from it in that the material administered is inert. For this purpose 'dummy' tablets of oestrin or a solution of sterile olive oil may be employed. This procedure serves to differentiate the more fanciful complaints which tend to disappear, from the genuine symptoms of ovarian deficiency or gonadotropic excess which persist at the conclusion of such a course.

Hot Flushes as an Indicator—The hot flush is the most clearly defined of the subjective symptoms, and is therefore a valuable indicator of progress. The patient should be instructed to keep a note of the daily number of hot flushes both during the preliminary period of 'control' treatment and later when active oestrogenic compounds are being administered. One should aim not at complete elimination of the hot flushes but at reducing them to one or two every day or every other day, since, as has already been pointed out, the object of the treatment is not to postpone the menopause artificially by giving large doses of oestrin, but to alleviate the symptoms sufficiently to allow the patient to accustom herself as comfortably as possible to the new level of endocrine balance.

Dosage of Oestrin

With this object in view it is obviously desirable to start with relatively small doses, the administration of large doses from the beginning in order to enhance one's reputation with the patient by procuring miraculous and immediate results is to be deprecated. In the milder cases it is well to begin by giving 1,000 international units daily by mouth. There is usually a latent period before an effect is established, and one should consequently persist in this dose for at least a fortnight. At the end of this time evidence of progress or otherwise should be sought from the records of frequency of hot flushes and from the microscopical examination of the vaginal smear, and with the aid of these indicators the dose should be cautiously raised until the correct level is established. From this plateau one should equally cautiously descend. The symptoms can usually be kept under control by oral administration but some of the more serious manifestations such as severe attacks of mental depression, may require relatively high doses by injection. Such injections should be administered twice weekly and intramuscularly. There are certain disadvantages of high dosage therapy. The patient may complain of unpleasant minimal symptoms, or she may actually experience a period which is in fact an oestrin withdrawal bleeding some days after the cessation of the course of treatment. Unless previously warned of this possibility she is apt to be alarmed and to lose confidence in her medical attendant. High dosage therapy should never be continuous but always intermittent otherwise it may cause tenderness and swelling of the breasts, cystic endometrial hypoplasia or deleterious effects from prolonged inhibition of the pituitary.

The beneficial results of successful oestrin therapy include apart from the relief of symptoms the development of a feeling of well being, and in some cases a return of sex desire.

Sequels of the Menopause

There are certain late sequels which may follow a symptomless menopause and occur as late as six or seven years after the cessation of the menses. These are directly

due to ovarian deficiency, and remarkably satisfactory results have followed treatment with oestrin. To one group belong the conditions resulting from the lack of ovarian stimulus to the external genitalia, such as atrophic senile vaginitis and ulceration, pruritus and kraurosis vulvae, associated with dyspareunia as the result of the shrunken and tender introitus, and, according to some authorities, leucoplakia vulvae. Another group consists of a number of skin lesions which are gradually becoming recognized as being associated with the menopause. One example is a patchy keratosis which is typically confined to the palms of the hands and the soles of the feet, and which appears to benefit from oestrin therapy.

"NIGHTMARE'S NEST"

LONDON SEEN AS AN INFERNO

It is commonly held that the habit of understating one's case is peculiarly a British, even an English monopoly. If it is primarily, as some contend an affectation or a piece of illogical hypocrisy, it is so extraordinarily effective that it has become almost part and parcel of the English method of conducting controversy. But it does not appeal to everybody, and conspicuously not to Mr Robert Sinclair, whose savage attack on London, Londoners, and London government, entitled *Metropolitan Man*, overstates so grossly and unfairly what might (or might not) have been a good case if it had been put with moderation that it is bound to have an effect exactly opposite to that which its author may be assumed to have desired—that is the general uplift of our social conditions. After 323 pages packed with choice and savage invective against London and everything connected with it, including politicians of all parties, he concludes with a note to the reader in which he claims that his book is not intended to be a vehicle of opinion that his presentation of statistics is "common sense arithmetic," and that his virtue lies in the disinterment from Blue Books and similar publications of guaranteed facts.

The sensationalism and the violence of Mr Sinclair's criticisms—the long list of sources (given at the end of the book) from which his statistics have been derived, and the implied failure of preventive medicine to remedy the dreadful state of public health in London will probably lead thoughtful laymen to ask members of the medical profession whether Mr Sinclair is right or wrong or perhaps how far he is right and how far he is wrong. It is therefore advisable that some critical examination of the statistics presented should be made in order that doctors may be able to assist the layman on such points. It is not enough to say that Mr Sinclair is a sensation-mongering pessimist deliberately shutting his eyes to everything that is good, ignoring purposely (as he himself confesses, on page 20 that he does) the great and steady improvements of the last two or three generations and twisting facts and statistics to suit his preconceived ideas and prejudices. It is necessary to see where and how he has erred in arriving at conclusions which to anyone who knows London are so obviously fantastic.

Tuberculosis in the Metropolis

No better illustration can be selected, perhaps than his treatment of the tuberculosis figures for London. Everyone knows that for sixty years past tuberculosis has been a steadily declining disease and that its control is in fact one of the high spots of preventive medicine. Readers of *Metropolitan Man* might well conclude that the exact contrary is the case for Mr Sinclair out of the masses of statistics at his disposal picks out for

his sole quotation the (indisputable) fact that in 1930 there was a definite and considerable increase in the mortality rate from tuberculosis amongst females in the 15 to 25 years age group and makes great play with this regrettable and unexplained occurrence. It is therefore a matter of public interest and public concern to state quite definitely that since 1930 the rates of this particular group have declined as in all other groups they have been for fifty or sixty years declining and to put down in black and white the broad facts about tuberculosis as a whole. The death rate in London from tuberculosis—all forms, not pulmonary tuberculosis alone—has been as follows:

1891-1895	yearly average per 1,000 living	2.63
1896-1900		2.44
1901-1905	"	2.15
1906-1910	"	1.87
1911-1915	"	1.78
1916-1920	"	1.77
1921-1925	"	1.20
1926-1927	"	1.06
1933	"	0.93
1934	"	0.87
1935	"	0.79

But not a line or a word of Mr Sinclair's would lead any reader to suspect that progress on this astonishing scale has been and is being achieved by the people he spends his time in abusing. As for his particular age and sex group the L.C.C. reports show that in 1910 there were 1,229 notifications—the deaths are not given separately every year—and that in 1934 there were in the same group 1,060 notifications in 1935 967 notifications and in 1936 931 notifications. In connexion with tuberculosis in children he has bitter and burning words to say about the maiming and crippling brought about by the surgical forms of the disease but he does not tell his readers that whereas fifteen years ago the distribution of Lord Mayor Treloar's Christmas hampers for cripples involved picking and choosing among the applicants nowadays there are not enough cripples to go round nor does he quote the figures that he might have got from one of the actual documents which (in this connexion) he quotes—namely, that tuberculosis in children caused 10,637 deaths in England in 1911 and 6,053 in 1924.

More "Common sense Arithmetic"

When Mr Sinclair ventures on prophecy he is of course less amenable to criticism—anyone can prophesy, and no one can say for many years whether the prophecy is right or wrong. In London there were in 1935 575 cases of suicide. Mr Sinclair's handling of this figure is to commit himself to the statement emphasized in bold type on the dust wrapper that *ninety thousand future suicides are walking the streets of London to day*. It is not unfair to say that if his prophetic powers are on a par with his common sense arithmetic no one need pay much attention to his anticipations. Elsewhere he proceeds to examine maternal mortality which he says has grown worse in the last twelve years here too. It is profitable to study the actual London figures which are as follows: 1924 3.08 per thousand births, 1925 3.19, 1926 3.35, 1927 2.91, 1928 3.59, 1929 3.61, 1930 3.33, 1931, 3.81, 1932 2.99, 1933 3.66, 1934 2.80, 1935 2.58 (the lowest on record). He further names four Continental countries where the figures are stated to be lower but he does not say whether as in London the statistics include deaths from abortion which very heavily weight the figures in this country.

On the nutrition of school children his presentation is equally untrustworthy. He says that fewer than 1 in 6 of London children appear to be adequately nourished and that 57 per cent are definitely undernourished. This is an interpretation of the Board of Education reports which in our judgement distorts the facts and the truth. The actual number of really and incontrovertibly under-

* The provisional approximate figure for 1936 given by courtesy of the M.O.H. for London is 2.75.

¹ *Metropolitan Man: The Future of the English*. By Robert Sinclair. (Pp. 365. 10s. 6d. net.) London: G. Allen and Unwin, 1937.

nourished children in the Council schools—not in London as a whole be it noted—is about 0.08 per cent, the number of the adequately nourished is about 94 per cent.

There are many other counts in the indictment upon which equally damaging criticisms might be founded. According to this book there is not a single aspect of London life and London government which is not a seething mass of mismanagement and corruption. Curiously enough, hundreds of intelligent foreigners who have visited London during this century and investigated the methods of its administration have gone away full of admiration and determination to bring their own domestic affairs up to a similar standard if possible. That things are perfect, or anywhere near perfection, is the very last impression that anyone ought to propagate, we agree, that Mr Sinclair is animated by a sincere desire for amelioration, we agree, that the medical profession has a special duty in relation to the education of the public in matters of public health, we agree. But we do not agree that to shut one's eyes to the genuine and rapid progress of many years past, and to the signs of its continuance at an accelerating rate, is a useful contribution to the cause, and, most emphatically of all, we do not agree that the garbling of statistics serves any useful purpose—and in our view that is an act of which Mr Sinclair stands definitely convicted. This is an understatement of London's case against Mr Sinclair.

HENRY ROBINSON

MEDICINE IN THE LONDON COUNTY HOSPITALS

The varied and extensive hospital services provided by the London County Council are the subject of two annual reports—the first already reviewed dealing mainly with the administrative aspect and the second a medical supplement compiled by members of the Chief Medical Officer's staff.¹ This latter report contains a series of articles describing the work carried out in various special units which have been established at the county hospitals. One of these is the puerperal fever unit at the North Western Hospital in connexion with which an analysis is given of 156 patients with local uterine sepsis admitted during the year under review with eleven deaths. Another is the radiotherapeutic clinic at Lambeth Hospital with 567 new patients placed on its records during the year. There is also a plastic surgery unit at St James Hospital, where 386 operations were performed including fifty-nine Thiersch grafts. Two thoracic surgery units have been established, at St Andrews and St James Hospitals, and here on patients about half of whom were suffering from chronic pulmonary tuberculosis, a total of 285 operations were performed principally thoracoplasty, thoracoscopy, and cauterization of adhesions and phrenic evulsion. In the gaiter clinic at the New End Hospital operations were carried out on 100 patients with no mortality. Brief reports are included from the arthritic unit of St Stephen's Hospital, the diabetic clinics at St George in the East and St Peter's the congenital syphilis unit at St John's the urological unit at St Mary Abbots and the out-patient fracture unit at Fulham Hospital. At the last which is the most recent of these special units from thirty-eight to forty-five cases are seen at each weekly session.

Research in Council Hospitals

The report also includes a number of articles written by members of the Council's medical staff regarding unusual cases. Thus the case of agranulocytosis which was the subject of an inquest at Shoreditch some time ago

(*British Medical Journal* December 7, 1935, p 1135) is set out in full detail. Two cases of idiopathic steatorrhoea are described, and one case of Rendu Osler-Weber disease, a hereditary condition characterized by haemorrhages due to multiple telangiectases. A case is also recorded of primary tuberculosis of the spleen, only six like cases could be found in the British journals two of which were described by Carling and Hicks in the *British Medical Journal* of August 15 1925. From another article it appears that the condition of acute dilatation of the stomach is not so uncommon as is often thought at Bethnal Green Hospital during the past five years five cases have been recognized and treated successfully.

A considerable amount of research is carried on every year in the diagnosis and treatment of infectious diseases admitted to the fever hospitals. In the present report five medical superintendents write on various conditions. Dr J D Rolleston reviews 104 cases of acute poliomyelitis admitted to the Western Hospital in eight years. Only four deaths occurred in this series, all from ascending paralysis. Apart from a number of cases treated by the Drinker respiratory apparatus, the patients did not receive any active treatment, but the affected limbs (usually the leg) were put in splints as recommended by the consulting orthopaedic surgeon. In fourteen cases the symptoms were of sufficiently recent onset to justify giving convalescent serum, but in no instance did demonstrable benefit result. In a paper on whooping cough Drs. Mitman and Ronaldson state that drugs and vaccines exert no consistent influence once the disease has become established, and though attempts to produce an efficient vaccine are being made, no real success has as yet been achieved. It is pointed out that whooping-cough is responsible for the longest average stay of any of the diseases treated in a fever hospital (the average in London is fifty-six days) yet the actual period during which there is danger to the patient on account of complications or to the community on account of infectivity rarely exceeds four weeks. If the public could be educated to the fact that whooping as such is not infectious many cases could be discharged from hospital much earlier.

Maternal Deaths

A section of the report is taken up with a series of articles tracing the origin and development of services which the old Local Government Board placed upon the Metropolitan Asylums Board and which have been inherited by the Council. These include a hospital for the treatment of venereal diseases in women, where there were 369 admissions in 1935, hospitals and sanatoria for pulmonary tuberculosis, a special hospital for the treatment of skin diseases, a hospital for the isolation and treatment of contagious ophthalmia, and a hospital for patients suffering from diseases of the ear.

Finally there is an analysis by Dr Letitia Fairfield of the deaths of women in childbirth in Council hospitals. During the year under review the number of women confined in these hospitals was 15,280 over 2,000 more than the previous year and 50 per cent more than in 1931. Of this number sixty-four died, the deaths in forty-two cases being returned as due to pregnancy or confinement and in twenty-two as associated therewith. A further twelve women died in hospital after having been delivered elsewhere. There were fifty deaths from abortion (out of 3,607 cases treated) and four from ectopic gestation (out of 136 cases). The deaths from sepsis fell from fifteen in 1934 to twelve in 1935. Caesarean section was performed on 120 patients with eight maternal deaths, nine stillbirths and five deaths of infants under ten days. As for the forty-two deaths which were due to pregnancy or confinement after delivery had taken place in hospital, twelve were due to puerperal sepsis, nine to toxæmia, nine to haemorrhage, eight to obstetric shock, and the others to rupture of uterus and puerperal mania, while one patient (with a greatly enlarged thymus gland

British Medical Association PROCEEDINGS OF COUNCIL

TUESDAY AND WEDNESDAY, APRIL 6 and 7, 1937

A meeting of the Council of the Association was held on Tuesday and Wednesday April 6 and 7, at the Association Headquarters in London. Sir KAYE LE FLEMING, Chairman of Council, presided, and the other members present were

Mr H S Souttar (Chairman of Representative Body) Mr N Bishop Harman (Treasurer) Sir E Farquhar Buzzard Bt (President) Professor R J Johnstone (President Elect) Dr H G Dain (Deputy Chairman Representative Body) Mr J Armstrong Prof R J A Berry Dr J W Bone Sir Henry Braekentbury Prof A H Burgess Dr J D Comrie Mr W McAdam Eccles Dr C E S Flemming Dr E R Fothergill Dr T Fraser Mr J L Gilks Dr P L Giuseppe Dr I G Glover Dr F W Goodbody Dr R G Gordon Lieut-Col C H H Harold Dr C O Hawthorne Dr J Henderson Dr J Hudson Dr J Hunter Dr I Jones Mr E Lewis Lilley Dr J C Loughridge Dr P Macdonald Sir Ewen Maclean Dr J S Manson Dr O Marriott, Dr J C Matthews Dr J B Miller Dr H J Milligan Sir Richard Needham Mr R L Newell Dr L A Parry Dr W Paterson Prof R M F Picken Dr H W Pooler Colonel A H Proctor Dr J R Prytherch Dr H Robinson Dr E H Snell Dr P B Spurgin Surg Rear Admiral A R Thomas Dr W E Thomas Dr G Clark Trotter Wing Commander H M Stanley Turner Dr S Wand Mr N E Waterfield Dr W Watkins Pitchford Dr W N West Watson Dr W G Willoughby, Dr F T H Wood

Apologies for absence were intimated from the following

The Past President Sir Crisp English Dr H C Jonas Dr R Langdon Down Dr J P Shanley and Dr D Lyon Steven on

The Council sent a message of sympathy to two of its members Dr R Langdon Down and Dr H C Jonas who were absent through illness. The Chairman welcomed Dr T C Routley of Toronto General Secretary of the Canadian Medical Association who attended during a part of the Council proceedings

Personal

Before proceeding to business the Chairman of the Representative Body voiced the feelings of the whole Council in extending to Sir Kaye Le Fleming their hearty

congratulations upon the honour which he had recently received at the hands of the King. Mr Souttar said that it was an honour amply earned after many years of hard work on behalf of the medical profession including five years as Chairman of the Panel Conference three years as Chairman of the Representative Body and three years in the still more arduous position of Chairman of Council. His work outside the Association in particular as a member of the General Medical Council was an additional reason for the honour conferred upon him. He knew that Sir Kaye Le Fleming felt and would wish them to feel also that it was an honour conferred upon the British Medical Association as well as upon himself. To him in no small degree was it due that the Association in recent years had grown so markedly in prestige and influence.

The Chairman of Council after expressing his appreciation of the remarks made and the endorsement which they had received from the Council apologized to individual members who had written him charming letters of congratulation, which he had not as yet been able to answer. The amount of correspondence to which this circumstance gave rise was something quite unanticipated and it came at a time when he was heavily engaged in practice. Moreover he preferred where possible to thank his friends personally. He would be insincere if he pretended that the honour had not given him great personal satisfaction but he did wish to echo the words of the Chairman of the Representative Body when he said that this was an honour in which the Council and in a lesser degree all the members of the Association shared. It was an acknowledgement of the position which the Association occupied to-day. He would only add that so far as his public life was concerned he had been nurtured in the Association. He had never done any kind of public work until he first became honorary secretary of his Division and the Association had taught him all he knew in that respect and had helped him to develop such faculties as he might possess. It would always be his dearest wish to serve the Association and the Council to the best of his ability.

The Chairman then went on to express on behalf of the Council their pleasure on seeing with them the Medical

Secretary on his return from India. Nobody appreciated that more than the Chairman of Council, to whom the Medical Secretary in his office was a tower of strength. At the same time he wished to say how extraordinarily well served the Council and the Association had been in Dr Anderson's absence by the Deputy Medical Secretary, Dr Hill. He proposed that the Council place on its minutes an expression of its appreciation of the way in which Dr Hill had acted in this respect.

Communications all expressive of the pleasure with which Dr Anderson's visit had been received in India were placed before the Council from Major-General D S Skelton, acting D.M.S., India, and the Punjab, Bombay, Assam, and Calcutta Branches.

Dr Anderson said that he had had a most interesting time, but this was one of the most tiring pieces of work he had ever accomplished in his life. It was not only a question of the very extensive travel, but of being constantly at call at every place he touched. He thought that if his visit had done nothing else it had served to allay suspicion and to remove some misconceptions with regard to the Association and its activities. He had no doubt whatever that the visit was worth while. It would be worth while to himself as an executive officer of the Association in dealing with members who contemplated going to India, and also when in due course certain changes, particularly in the I.M.S., came to be considered. His report would be made to the appropriate committee and would if the committee so decided, be placed before the Council. Therefore the present was not an appropriate occasion to speak of the position in India as he found it or to put forward the suggestions which would in due course be made. He wished only to say how extraordinarily well he was received, and what kindness and hospitality were shown him everywhere by Indian and European alike.

Finance

The Treasurer presented the Financial Statement of the Association for 1936. He said that the outstanding feature of the Income and Expenditure Account was the allocation of £15,000 against commitments for extension of premises. In 1935 and previous years that allocation had been £6,000. The past year had been a good one. Receipts had increased on several counts but the most noteworthy feature was the absence of any exceptional and unexpected expenditure such as last year, when the Association had been called upon suddenly to undertake large law costs entailed by the opposition to the Bill promoted by the osteopaths. When there was an exceptional surplus such as in this year the first concern of the Finance Committee was to make such provision as might be possible against heavy commitments entailed by contract for the buildings which the Association would have to proceed with towards the end of the present year. The customary reserve for printing plant was no longer necessary in view of the altered arrangements for printing the *Journal* and therefore the amount held in reserve for this purpose had been transferred to the reserve against commitments for extension of premises making with the £15,000 just mentioned a total of £26,716. That might seem a large sum but it was only a small part of that which would be needed to meet a contracted liability. In dealing with other items in the accounts Mr Bishop Harman drew attention to a new item in general Association expenses of £797 as a grant to the Australian Federal Council. In reply to Dr Macdonald the Treasurer said that the £503 set out in the Income and Expenditure account as a refund from the National Ophthalmic Treatment Board did not represent the completion of the return of the loan but since the accounts had been made up the remaining amount outstanding had been received from the Board. So that the whole of the money advanced had been repaid. He also mentioned that the Finance Committee had appointed a subcommittee,

consisting of Drs. Dain Parry, Robinson, and himself, to consider the making of provision for depreciation and the financing of the commitments for the extension of the Association's premises.

The report of the Finance Committee was approved.

Organization

Dr Matthews, chairman of the Organization Committee, brought forward a recommendation that members of fifty or more years standing be allowed to remain in the Association without payment of further subscriptions. He said that the number concerned was approximately 190, and his committee had thought it would be a graceful act if the subscription were remitted altogether in their case.

Dr Flemming, speaking as one of this very select group thought the concession ought not to apply to members who were in active practice. Those of them who like himself were still able to be in active practice after fifty years' membership felt that the Association had lengthened their working lives by the interest it had stimulated and by the large number of friends it had brought. Dr Matthews said that he much appreciated Dr Flemming's suggestion, but it was so difficult to say when a doctor had retired that it would be almost impossible to frame a regulation to cover it.

The proposal was agreed to as a recommendation to the Representative Body. Dr Hawthorne suggested that there was one possibility of uncertainty about this recommendation—namely, whether the fifty years must be continuous!

It was also decided to recommend to the Representative Body that the concession whereby members not engaged in medical practice who were whole time members of the teaching staff of a university or medical school paid a reduced subscription of two guineas should be extended to the whole time medical instructors recently appointed by the Air Raid Precautions Department of the Home Office. Dr Matthews said that this affected fifteen or twenty individuals.

It was further agreed to arrange for the supply of the *British Medical Journal* to senior medical students in Great Britain and Northern Ireland at a nominal subscription of half a guinea. The student would be required to make a declaration that he was at a given medical school, that he had completed the second year of the clinical part of the curriculum, and that he was not a qualified medical practitioner.

The matter of the peripheral organization of the Association was brought forward on the report both of the Medico-Political and the Organization Committees. It was the experience of the former committee that the organization at the periphery was weak in certain aspects more particularly in regard to parliamentary and local legislation, and it considered that an investigation should be made with a view to strengthening it. The Chairman of Council said that this was likely to be a very large piece of work indeed and the difficulty he saw was that many members of Council were already so closely engaged in committee work that it would be impossible to expect them to do more at the moment.

At a later stage Dr Matthews who said that as chairman of the Organization Committee he welcomed this investigation proposed that the matter be referred to a special committee consisting of the Organization Committee with the addition of Dr Bone and Dr Wand as representing the Medico-Political Committee, Dr O T J Clayre honorary secretary of the Southern Branch and Dr L Kilroe honorary secretary of the Rochdale Division for investigation and report. This was agreed to.

The Chairman of Council was authorized to forward special letters of recognition of the services given by Dr D R Macdonald honorary secretary of the Sudan Branch and Dr C J Fuller honorary secretary of the Exeter Division who have recently relinquished office.

Representation of the Profession in Parliament

Mr Bishop Harman presented a report from the Parliamentary Elections Committee. This was concerned with the action taken in the recent by-election in the Combined English Universities. He said that at the last Annual Representative Meeting it was directed that steps should be taken to make preliminary inquiries for the selection of a medical practitioner intimately acquainted with the aims and policy of the Association with a view to his election to Parliament for one of the university seats. On this vacancy occurring the committee persuaded Sir Henry Brackenbury much against his own inclinations, to stand. He was the most admirable candidate they could have chosen, and the opportunity seemed a promising one, but unfortunately the result was disappointing.

The Chairman of Council said that in view of the strong expression on this subject in the Representative Body the Council would have been criticized if it had not done its best to persuade Sir Henry Brackenbury to stand. Dr Hawthorne said that he could not agree that the committee owed any apology either to Sir Henry Brackenbury or to the Council for its action. It had seen an opportunity and seized it with promptness and decision. Sir Henry Brackenbury had consented with some reluctance but out of a sense of duty to the Association to offer himself for election. The result it was true had been disappointing and the loss was by no means confined to the medical profession, but whilst they owed Sir Henry Brackenbury thanks for embarking on this enterprise there was no need for apology.

Sir Henry Brackenbury said that he did not wish to traverse ground covered by a letter from him which appeared in the *Journal* of April 3, but there were one or two things he desired to say in addition. The first was that the Association owed its gratitude as he did personally, to those in the office who undertook the work attaching to the candidature. Certain lessons had been learned and should another university election be sought these would prove useful. The Deputy Medical Secretary and his staff did what seemed to him an extraordinary amount of good work which was deserving of thanks. In the second place the election disclosed a distressing lack of effectiveness in the peripheral organization of the Association, and, from correspondence which he received brought to light some astonishing misconceptions entertained by members of the medical profession with regard to the policy of the Association. One protest received actually stated that the Association stood for a whole time salaried medical service for the nation, and therefore the elector could not possibly support his candidature! Such misunderstandings almost made one despair of bringing home the policy of the Association to the rank and file of the profession. Again the result brought out the impossibility of achieving anything like a common action amongst their own members. Here was a constituency of which more than half the electors were either doctors or teachers but of the 4,500 medical graduates of the universities concerned those on the electoral register numbered no more than 3,056. Therefore at least one third of the doctors who were graduates were not electors, not having taken steps to secure registration. But out of those 3,056 he could not have received more than 1,000 votes and he knew that he received 700 or 800 votes from the teachers. The circumstances raised the whole question whether it was of any use persisting in seeking representation in Parliament even through a favourable university constituency.

Dr Pooler said that he had taken a personal interest in the campaign and he made certain observations as a result of his experience. There were a large number of members of the profession—doctors on both sides—who would vote with their party whatever their personal or professional interests. A governing factor in the election was the strong appeal and energetic campaign of the

successful candidate, Mr Harvey who although standing as an Independent, enlisted the Liberal and Labour vote.

The report of the committee was approved. It was also agreed that the whole question of Parliamentary representation should be reviewed by the Parliamentary Elections Committee and with this in view a recommendation by the Medical Political Committee for the appointment on the headquarters secretarial staff of a liaison officer in Parliamentary medical matters was postponed until the Parliamentary Elections Committee had reported.

Psychological Medicine Group

A petition signed by 175 members for the formation of a Psychological Medicine Group within the Association was laid before the Council. The petition which was published in the *Supplement* of January 30 had been referred to the Science and Organization Committees, which recommended that the Council accede to the request. Dr W. G. Masefield and Dr A. A. W. Petrie attended in a deputation from the signatories.

Dr Petrie said that those who were engaged in the study and practice of psychological medicine were a scattered group and their representation through the Divisions was liable to be a very isolated one, so that their particular point of view was apt to be swamped by the general interests of the other members. There was a distinct necessity for an Association policy with regard to psychological medicine. Since the Act of 1929 came into operation there had been a great deal of bureaucratic development in connexion with the work of those engaged in institutions whose position and autonomy had been considerably altered in consequence. A reasonably autonomous condition of service should be afforded for those who did institution work throughout the country. The doctor had always been to a very large extent an independent person one who was allowed to think for himself and not unduly subject to bureaucracy. The Association had protected the interests of many branches of the profession, such as the public health services and the Services of the Crown and it could do still more valuable work in safeguarding the independence of those engaged in mental hospitals.

Dr Fothergill drew attention to the criteria for inclusion in such a group. It was proposed that membership should be confined to those members of the Association who were engaged predominantly in the practice of psychological medicine and who signed a declaration to that effect. To his mind the term predominantly was dangerous. Other groups consisted exclusively of consultants and specialists or whatever the class of members might be. To establish a group for those engaged predominantly in a speciality would lead to trouble in the future.

Sir Henry Brackenbury pointed out that the petitioners themselves had asked for the formation of a group of those limited in their practice to psychological medicine. As they had asked for this it seemed a pity to widen the door by introducing the word predominantly. In his own view every general practitioner in the country was predominantly engaged in the practice of psychological medicine. The term 'engaged predominantly' was less valuable as a definition, and liable to make the group too inclusive. He moved that the phrase be substituted 'those limited in their practice to psychological medicine.' Dr Fothergill seconded.

Dr Gordon reminded the Council that a few years ago it adopted a report from a committee which had been set up to consider the relationship of mental hospitals and general practitioners and the Council then had expressed the hope that in future mental hospitals would be staffed by visiting physicians from general hospitals. Surely such a group as was now proposed would be more useful if it were to some extent leavened by a number of people whose practice was not limited to psychological medicine.

Sir Ewen Maclean said that the article governing the formation of groups read: 'Special groups of members

having distinctive professional interests may from time to time be formed' In the consequential by-laws there was nothing which laid it down that membership must be exclusive to the specialty concerned Every group was in part recruited from general practice, and if it was ordained that the members of a group must be those limited in their practice to one particular specialty it would prevent the practitioner who might be practising along that line, though not restricting his practice thereto, getting into touch with his colleagues

The amendment to replace the word 'predominantly' by the word 'limited' was lost, and the Council acceded to the request for the formation of the group, and laid it down that the group should be comprised of all those members of the Association who are engaged predominantly in the practice of psychological medicine

Rules for Industrial Medical Officers

Dr Bone, chairman of the Medico Political Committee, brought forward a code of model rules which the committee had prepared, outlining the duties and governing the ethical conduct and relationships of industrial medical officers The rules had been submitted to the Central Ethical Committee, and the suggestions made by that committee had been embodied

Dr Dain drew attention to certain ambiguities of statement in and omissions from the document, which it was promised should be rectified before the rules, as intended, are recommended for approval to the Representative Body

Dr Macdonald thought the Association should be careful only to lay down rules which were likely to secure compliance, and in his view certain of the proposed rules failed in that respect It must be remembered that a very large amount of the work of the industrial medical officer was the treatment of quite minor casualties such as would not have the attention of a doctor at all were it not for the fact that the doctor was on the spot, they would be dealt with by nurses or first aid personnel Therefore, to place upon the industrial medical officer, as the rules laid down, the requirement that he should inform the workman's own practitioner whenever emergency or first aid treatment had been given seemed quite unnecessary Only where there was a residual disability, or was likely to be such disability, or something had taken place which was likely to affect the medical history of the individual was it imperative that communication should be made with the private doctor It was also stated that where the industrial medical officer in an emergency sent a workman to hospital he should advise the workman's medical attendant Should not that more properly be done from the hospital itself? Again, another rule laid it down that except in emergency the industrial medical officer should not carry out any individual preventive measure without the individual consent of the worker and prior agreement with the worker's medical attendant What about a case where a workman performing certain difficult manipulations had 'soft hands', and was advised by the works medical officer to wear gloves or in conditions trying to the eyesight to wear goggles, or again if subject to SO fumes to wear a respirator? Was the works medical officer to be prohibited from advising such measures?

Dr Bone said that none of the examples cited by Dr Macdonald came within this rule The rule was designed to prevent experiments which involved the active participation of the workers without their consent and the prior notification of the worker's doctor An example would be preventive inoculations A procedure of that kind should surely come under the medical attendant As for the wearing of gloves and goggles such measures were already laid down as among the advisory duties of the industrial medical officer

Professor Picken said that it was clearly inoculation which the committee had in mind in drafting this ethical rule, but there might be interference of other kinds which it was desirable to cover by such a rule He thought the

words, 'any form of specific prophylaxis might be substituted The whole question was in its infancy, and any code such as was now being elaborated should be subject to modification from year to year as experience went on He thought that the word 'should' might reasonably be substituted for the word 'shall' in the document

Wing Commander Turner said that there appeared to be some confusion in the minds of members between protective measures as laid down in the Factory Acts and prophylactic measures such as might be undertaken in connexion with experiments In many cases the wearing of gloves or of goggles in the case of welding plant was laid down already in various Orders

Dr Bone also said that statutory requirements were quite outside the purview of these rules

Dr Wand said that the subcommittee drafting these rules had used the mandatory verb in certain cases at the request of industrial medical officers in order that their hands might be strengthened These ethical rules were, first, a code of good manners, and, secondly, a means of protection for the works medical officer who was asked by his employer to do certain things which in his opinion he ought not to do If he was able to show his employer the requirements of such an ethical code it would be of great assistance Accordingly the word 'shall' had been used in certain places to enable him to insist to his employer that he must not carry out a particular measure, and such prophylactic measures as had been mentioned were probably the most important It was obviously undesirable that a works medical officer should be able to inject into the arm of an individual a vaccine or anti serum irrespective of whatever illnesses the man might have suffered from or of his medical history as known to his own doctor For that reason it was laid down that the works medical officer shall in no way associate himself with experiments which involve the active participation of the workers without their consent and the prior notification of the worker's doctor, no matter whether they were mass experiments or individual ones He took exception to what he had gathered to be a statement by Dr Macdonald that a minor injury such as a cut finger involved no liability to residual disablement He was pretty sure that if every case of a cut finger which received first aid dressings was directed to the doctor's surgery the same day disabling finger conditions would be very greatly reduced

With regard to one of the rules which laid it down that the industrial medical officer should not hold the position of certifying factory surgeon in the same area as that in which the factory concerned was situated Dr Bone said that in the new Factory Bill there was a proviso whereby the Home Secretary was allowed in certain special circumstances to permit the industrial medical officer to be the certifying factory surgeon Representation had been made to the Home Secretary that although the Association did not challenge this clause it did suggest that it should be used only on the rarest occasions The point was that the works medical officer was an employee of the factory whereas the certifying factory surgeon was an independent person and it was very important that his independence should be maintained

An amendment to substitute the word 'should' for 'shall' generally throughout the document was lost and it was agreed that subject to verbal rectification, the rules should be recommended for approval to the Representative Body

Nursing Problems

About a year ago a communication was made to the Association from the College of Nursing inviting its views upon a number of nursing questions raised by that body Thereupon a joint subcommittee was formed from the Medico-Political and Public Health Committees and Dr Bone now presented its report to the Council It is hoped that the report will presently be published in the *Supple*

ment Dr Bone explained that the College of Nursing was a voluntary body analogous in some respects to the British Medical Association and it admitted only fully State registered nurses. The General Nursing Council was a statutory body resembling in some respects the General Medical Council. The report dealt with interchangeability of pensions, domiciliary nursing, the supply of and demand for the services of the trained nurse by the community, the care of the chronic infirm and other subjects. In drafting the report great help had been given by three members of the subcommittee—Dame Janet Campbell, Dame Louise McLroy, and Dr Marguerite Kettle who was honorary secretary of the *Lancet* Commission on Nursing.

In reply to Dr Fothergill, Dr Bone pointed out that the question of title (of different classes of nurses) was not intended to be dealt with, the subcommittee had been anxious not to interfere in questions of title, these being a matter for the nursing bodies themselves to decide. The report was approved.

A resolution was also agreed to with regard to some of the questions contained in papers for the final examination of the General Nursing Council. It was stated that these papers included questions relating to diagnosis and medical treatment, as distinct from nursing care, of certain diseases, some of them of a rare nature. One instance was cited in which the candidate had been required to give a full description of disseminated sclerosis and its treatment. It was the view of the Council that the inclusion of such questions must cause a candidate to spend valuable time in the study of matters which were not in effect the business of the nurse who might be more profitably employed in learning the essential principles of nursing.

A member pointed out that it was not the General Nursing Council that was at fault but members of the medical profession who set the papers.

Over-seas and Services

Dr W Paterson reported for the Dominions Committee, in particular with regard to the recent deputation to the Colonial Office. A summary of the matters contained in the report of this Committee appeared in the account of its meeting in the last issue of the *Supplement* (p 180). The Council endorsed the Committee's expression of regret at the retirement of Sir Thomas Dunhill from membership of the Committee and the Council, and its appreciation of the valuable services he had rendered in that capacity since 1921. A welcome was also given to Dr Isaac Jones as representative on the Council in Sir Thomas Dunhill's place of the South Australian, Tasmanian, Victorian and West Australian Branches for the remainder of the period 1935-8.

It was reported that representations had been made to the Air Ministry on the question of improvement in terms of service of civilian medical practitioners engaged under short term contracts and the Ministry had been asked to meet a deputation from the Naval and Military Committee on the matter. Wing Commander Turner stated that the power to employ a certain number of civilian practitioners was given to the Air Ministry under the recommendations of the Warren Fisher Committee. Although in some cases at the new aerodromes civilian practitioners were being employed instead of Service medical officers this was on account of the shortage of Service officers and the rapid expansion that had taken place in the opening of new aerodromes. It was hoped eventually that Service medical officers would be available for all these positions but in the meantime a doctor must be available and the only recourse was to employ a civilian practitioner.

Some consideration was given by the Council to the question of hospitality for overseas members visiting this country during the Coronation period. The difficulty was that there were no means of discovering how many such members would be in London, so that the arrangements

were bound to be of a somewhat elastic nature. It was left in the hands of the officers of the Association to do the best they could with a view to arranging a reception at headquarters.

Medical Ethics

Dr Waterfield chairman of the Central Ethical Committee, said that the Committee had had before it the question of the acceptance by practitioners of whole time public health appointments under authorities which were not applying the Memorandum of Recommendations or of appointments not in conformity with the Memorandum. The Committee, after discussing the matter with representatives of the Public Health Committee was satisfied that the Important Notice and the binding resolution in relation to public health appointments were not wholly effective, and would welcome any arrangement to bring about an improvement in this respect.

Professor Picken said that as one of the members who discussed the matter with the Ethical Committee he was well satisfied with the consideration given and he suggested that it be referred to representatives appointed by the Ethical, Public Health, and Organization Committees to explore the possibilities of an improved arrangement.

Sir Henry Brackenbury said that as one of the representatives of the Association on the Council of the Society of Medical Officers of Health he hoped that some active steps would be taken in the direction proposed. When the Memorandum of Recommendations was first adopted there was some feeling among the Association representatives that the Society of Medical Officers of Health was not taking such steps as it might take for the expulsion of its members who were acting contrary to the Memorandum but the Society reformed its machinery and in fact had taken steps to terminate the membership of some four or five persons who had transgressed the Memorandum. Owing to the autonomy of the Divisions the Association was in a somewhat different position but its machinery should be made more satisfactory if it was not to lay itself open to the reproach which it had at an earlier period levelled against the Society of Medical Officers of Health. There ought to be some strengthening of such disciplinary power as the Association possessed against those who habitually broke the agreement.

Dr Hawthorne said that the Ethical Committee was always anxious that the ethical force of the Association should be applied in suitable cases and in appropriate directions but it was necessarily held up by two considerations the first being that it could not act unless there was what was technically termed a representation from a Division and the second that it was the Ethical Committee which in the final stage was called upon to pronounce judgement, and therefore it could not at the same time initiate proceedings in the capacity of prosecutor.

The proposal to set up the joint subcommittee was agreed to.

Scotland

Dr J B Miller reported for the Scottish Committee that the position in regard to the Scottish scale of salaries for whole time public health appointments was improving. The details of the appointments made during the last seven years had been analysed and considered and the relative facts were being sent to the various Divisions in Scotland for their information.

He also stated that the first Sir Charles Hastings Lecture to be delivered outside London—at Glasgow by Professor E. P. Cathcart—was a great success. Quantitatively the audience had not been exceeded by any in the Great Hall in London and qualitatively so far as one could judge it had not been equalled. The questions were all pertinent and there was an absence of the peculiar type of crank who sometimes constituted himself a nuisance at such meetings.

Dr Miller further reported that the Health Services Committee had completed its review of the recommendations

of the Departmental Committee on Health Services in Scotland, and at its next meeting would consider a draft report

Physical Education

Sir Kaye Le Fleming, chairman of the reconstituted Physical Education Committee reminded the Council that it had been decided to reappoint that Committee in view of the possible further work that it might be called upon to do. Since that decision was made matters had moved forward very considerably. The Government proposals were now clearly set out and the three subcommittees of the National Advisory Council on Physical Fitness had been set up and had already met. Viscount Dawson of Penn and himself were the only medical representatives on that committee, they had met and discussed their attitude and had determined to bring constantly before the committee the medical aspect of physical education which was at present so deplorably neglected. They had pressed that in the new National Physical Training College for males there should be full facilities provided for study from the medical side of such aspects as nutrition, fatigue, the standard of physical fitness, and similar questions. Their views had met with a most cordial reception, and already there had been appointed a young biologist of considerable distinction who was going to be sent on behalf of the committee to the great training institutions on the Continent to study from the biological aspect the work done there and bring back a report.

The only recommendation from the committee concerned a reply which it was proposed to send to a petition that the Association should set up a joint standing committee with another (non-medical) body. The view that the committee took was that the setting up of such a joint committee would be a serious step only to be undertaken after great deliberation, and, when so many bodies were interested in physical education to take this step in regard to one of them or a section of them would be a mistake.

The recommendation was agreed to.

Various Business

Reports were presented to the Council from the Insurance Acts Public Health and Hospitals Committees, the principal matters in which have already been dealt with in the accounts given of the recent meetings of these committees in the *Supplement*. The report of the Consultants and Specialists Group Committee was presented by Professor Burgess and contained a recommendation, which was agreed to, for the division of Region 5 consisting of South Yorkshire and part of the East Midlands, into two regions each to elect one member of the Group committee.

The report of the Science Committee was introduced by Sir Ewen Maclean and dealt with several matters relating to the library and to Association prizes all of which will be found dealt with in the Annual Report of Council to be published in the next issue of the *Supplement*. The Council decided to bring to the attention of the various national medical organizations and of the Association Professionnelle Internationale des Médecins the opinion expressed in a minute of the last Annual Representative Meeting condemning unreservedly the use of poison gas in warfare as inhuman in its results and degrading to civilization. A report was presented by the Medical Secretary as correspondent of the Association on the A.P.I.M. detailing the work of the eleventh annual conference held at Amsterdam last September and it was resolved to include this as the personal report of the Association's representative in the Annual Report.

Sir Kaye Le Fleming presented a report from the Central Emergency Committee. He said that a great deal of responsibility would be thrown on the office of the Association in the event of war becoming imminent and machinery was being devised to ensure that the help would be as efficient as possible.

A report from the joint committee of the British Medical Association and the Trades Union Council was also presented by Sir Kaye Le Fleming. He said that a first meeting had been held, at which among others Sir Walter Citrine, Mr E. Bevin, and Dr H. B. Morgan were present, and the relations established between the two sides had been most friendly. One of the discussions which took place was on the possibility of sending at times to the Ministry on a common issue a joint deputation from the Association and the Trades Union Council. He looked forward to really good and useful work under the aegis of this joint committee. It was mentioned in the report that on the proposed National Health Insurance Bill the Trades Union Council had made representations to the Ministry of Health on a number of points and had expressed its view that the preventive work of the medical profession in respect of the age group 14-16 was of extreme importance and it would be a profound mistake to damage its efficiency by reducing the capitation payments to practitioners.

Dr W. H. Willoughby was appointed delegate of the Association to the eighth biennial Social Hygiene Congress, to be held under the auspices of the British Social Hygiene Council at Westminster in July next, and Sir Robert Philip (or failing him Dr U. Stobie) and Dr Ernest Ward, delegate to the twenty-third annual conference of the National Association for the Prevention of Tuberculosis, to be held at Bristol in July.

The Council expressed its sympathy with the protest of the Palestine Jewish Medical Association at the murder of the Jewish physician Dr. Lehrs, the only practitioner in the Arab town of Beisan, who was murdered by Arabs pretending to seek his aid.

A report was made by Dr Gordon for the Journal Committee and to this was appended a report of the Board of Directors. These reports dealt with technical matters connected with printing, supply of paper, advertisements and reprints. Sir Henry Brackenbury, while expressing gratification at the success of the new regime, hoped that there would be no tendency to regard the *Journal* as a property owned by the Association for financial profit instead of a service rendered to the members of the Association in part return for their subscription. Dr Gordon said that the Council might rest assured that the Journal Committee and the Board of Directors would always have it clearly in mind that the primary object of the *British Medical Journal* was service to the Association and the profession.

The Council devoted a considerable part of its first day's session to a consideration of office arrangements for the production and distribution of the *Journal* and of the proposed engagement of officials. Certain resolutions were brought forward by the Committee of Inquiry into office arrangements, and these with amendments were adopted and it was remitted to the Committee and to the Board of Directors to make recommendations to the June meeting of Council regarding the terms and conditions of service attaching to the proposed new appointments.

The Council sat from 2 p.m. to 6 p.m. on the first day and on meeting again at 10 a.m. concluded its business at 5 p.m. on the second day.

DANGEROUS DRUGS ACTS NOTICE

The Home Secretary has suspended until further order the operation of the notice published in the *London Gazette* and *Edinburgh Gazette* on August 28, 1934 withdrawing from Alexander Gordon Bonnyman M.B., Ch.B., now residing at Broxburn West Lothian, the authority granted by the Regulations made under the Dangerous Drugs Act, 1920 to duly qualified medical practitioners to be in possession of and to supply raw opium, coca leaves and Indian hemp and the drugs and preparations to which Part III of the Act applies, and has also suspended the direction given at the same time that it should not be lawful for Dr. Bonnyman to give prescriptions for the purposes of these Regulations.

TAKING THE CAR TO ULSTER

In view of the fact that many English and Scottish motorists are unfamiliar with motoring laws and conditions in Northern Ireland, the following details are given for the benefit of those members of the British Medical Association attending the Annual Meeting in Belfast who contemplate transporting their cars to the Ulster capital.

First and foremost the important fact must be emphasized that no Customs barrier exists between Northern Ireland and Great Britain. Therefore when the car has been disembarked on Northern Ireland soil the British motorist has no concern with irritating Customs formalities. Furthermore, motoring laws and regulations operating in Northern Ireland are practically identical with those in force throughout Great Britain with the one important exception—that a general speed limit for motorists is not applicable to this province. The visitor's driving licence, his Road Fund tax, and, in almost every instance, his insurance policy are all valid for a temporary stay in Northern Ireland. So it will be obvious that once transport arrangements are completed the motorist is entitled to drive where he chooses in any part of Ulster.

Transport by Sea

When considering a motoring holiday in Ulster the question of transport by sea is one of paramount importance to the motorist from Britain. There is a fairly wide choice of shipping services operating between English, Scottish and Northern Irish ports. For example, daily sailings take place between Liverpool and Belfast, Heysham and Belfast, and Glasgow and Belfast; cars may also be shipped daily between Stranraer and Larne. During the summer period—that is from May 1 until September 30—morning and evening services operate between the last named ports.

In addition to the foregoing steamship services operate between London, Plymouth, Southampton and Belfast. Full particulars of sailings, freight charges for cars and passenger fares are as follows:

LONDON-BELFAST (Clyde Shipping Co. Sailings from London each Tuesday and Friday)

Car Transport	OR
Per ton	£5 0 0
Minimum	£3 10 0

Passenger Fares	
Saloon single 55s	Return 100s
Third-class single 25s	

SOUTHAMPTON-BELFAST (Clyde Shipping Co. Sailings from Southampton each Saturday)

Car Transport	OR
Per ton	£5 10 0
Minimum	£3 10 0

Passenger Fares	
Saloon single 50	Saloon return 90s
Third-class single 22s	6d

PLYMOUTH-BELFAST (Clyde Shipping Co. Sailings from Plymouth each Friday)

Car Transport	OR
Per ton	£5 10 0
Minimum	£3 10 0

Passenger Fares	
Saloon single 45s	Saloon return (to Glasgow) 80s
(No call at Belfast on outward journey, but passengers are landed at Glasgow, paying their own fare thence to Belfast.)	
Third-class single 22s	6d

(On each of the above trips food costs about 10s. 6d. per day. Return tickets are available for six months but are not issued for third-class passengers.)

From the point of view of some English visitors the choice of route will lie between either Heysham or Liverpool and on both of these routes the loading and unloading facilities for cars are modern and quite satisfactory. There is little difference in the freight charges levied by the shipping companies concerned as the following figures will demonstrate:

BELFAST-LIVERPOOL (Belfast Steamship Co. Ltd. Sailings daily except Sunday)

Car Transport	
Weight not exceeding 10 cwt	£3 0 0
" " 15	£3 5 0
" " 20	£3 10 0
For each additional cwt. over 20 cwt	£0 1 6
Tricars up to 8 cwt	£2 12 6

Passenger Fares	
Saloon single 22s 6d	return 37s 6d
Third-class single 10s 6d	return 21s
(Return tickets are available for three months)	

BELFAST-HEYSHAM (London Midland and Scottish Railway. Sailings daily)

Car Transport	OR	CR
Weight not exceeding 10 cwt	£2 16 3	£3 3 9
Each additional cwt. or part	£0 1 6	£0 1 6

Passenger Fares	
Saloon single 22s 6d	return 37s 6d
Third-class single 10s 6d	return 21s
(Return tickets are available for three months)	

It is of importance to mention that a Sunday night sailing takes place between Heysham and Belfast and vice versa, although cars are not accepted for conveyance on Sunday nights.

The Scottish visitor too is well catered for so far as shipping facilities are concerned. He may proceed to Belfast via Glasgow direct via Ardrossan or via Stranraer and Larne. Here again freight charges do not vary to any appreciable degree. The rates on the various services mentioned are given below.

BELFAST-GLASGOW (Burns and Laird Lines Ltd. Sailings daily except Sunday)

Car Transport	
Not exceeding 10 cwt	each £3 0 0
Over 10 cwt. and not exceeding 15 cwt.	each £3 5 0
Over 15 cwt. and not exceeding 20 cwt.	each £3 10 0
Each additional cwt. or part	£0 1 6

Passenger Fares	
First-class single	£1 0 0
return	£1 12 0
Third-class single	£0 9 6
" " return	£0 19 0

(Return tickets are available for three months)

BELFAST-ARDROSSAN (Burns and Laird Lines Ltd. Sailings daily except Sunday)

Car Transport	OR
Not exceeding 10 cwt	each £2 10 0
Over 10 cwt. and not exceeding 15 cwt.	each £2 15 0
Over 15 cwt. and not exceeding 25 cwt.	each £3 0 0
Each additional cwt. or part	£0 1 6

Passenger Fares	
Saloon single 17s 6d	return 28s
Third-class single 8s	
(Return tickets are available for three months)	

LARNE-STRANRAER (London Midland and Scottish Railway. Sailings twice daily)

Car Transport	OR
Not exceeding 10 cwt	£2 5 6
Over 10 cwt. and not exceeding 25 cwt.	3 0 6
Over 25 cwt. for each additional cwt. or part	£0 1 6

Passenger Fares	
Saloon single 10	saloon return 20
Seetage single 6s	seetage return 12s

On each of the services mentioned a motor car may be shipped outward and return by the same route at a freight charge of fare and a half, provided the car is accompanied by two adult passengers for whom return tickets are valid.

The Automobile Association, which has offices at Port Officers at all ports mentioned, will provide loading and unloading operations will be pleased to advise the member of all matters connected with the shipment of vehicles. The A.A. will be glad to provide a car book and passenger information.

required procure passenger tickets and in other words complete negotiations on behalf of members so that the visitor is free from any petty annoyances connected with this aspect of his holiday. An important point to be remembered is that during the summer months—and this year will certainly be no exception—steamship bookings are particularly heavy, and it is very desirable that lengthy notice should be given to either the shipping company direct or to the A.A., to ensure that the required accommodation can be secured.

Garage accommodation for cars in and around Belfast need present no difficulty to the visitor. The city is adequately supplied with garage establishments which are efficiently staffed and equipped with modern plant thus ensuring the competent handling of any class of repair work.

Irish Free State—Those visitors who wish to embrace the Irish Free State in their tour should bear in mind that important Customs formalities must be complied with before a motor vehicle can be taken across the land frontier between Northern Ireland and the Irish Free State. In this direction it is suggested that those who are interested should make application to the nearest A.A. Branch Office, or to the Belfast Office of the association at Fanum House 5 Oxford Street, when full particulars of Customs requirements will be readily advanced.

We are informed that the R.A.C. will provide similar facilities for their members and they advise intending visitors to get into early communication with either their head office Pall Mall, London, S.W.1 or their local branch office 65 Chichester Street Belfast, well in advance of their departure.

Motorists desiring further information should apply to either the A.A. or the R.A.C. for the appropriate guide book. The Ulster Tourist Development Association 6 Royal Avenue Belfast have a very useful volume on motoring which includes a number of tours in and around Belfast and in Northern Ireland generally. Intending motorists are advised to apply for this to the above address.

OPHTHALMIC EXAMINATIONS AT HOSPITALS

There is a steady increase in the number of insured persons eligible for ophthalmic benefit who present themselves at the out-patient departments of voluntary hospitals for a general examination of the eyes. This constitutes an unfair demand on the voluntary services of the visiting ophthalmic surgeons and should be resisted by a refusal to examine unless the case is obviously one for hospital treatment. The patient should be referred to his approved society and advised how to obtain an ophthalmic medical examination at a reduced fee without recourse to hospital.

Similarly ophthalmic surgeons are experiencing a great increase in their work at hospitals on account of the growth of hospital contributory schemes. For members of these schemes the services of the honorary medical staff should be available only for such conditions as can best be treated at a hospital. A general eye examination for example is not essentially a hospital service. In their own interests the visiting staffs of hospitals are advised to watch carefully the inauguration and development of contributory schemes and to oppose vigorously any provision for ordinary medical services such as are available outside the hospital.

A book entitled *What is Osteopathy?* has just been published by J. M. Dent and Sons at 7s. 6d. The authors are Dr. Charles Hill, Deputy Medical Secretary of the British Medical Association and Dr. H. A. Clegg, Deputy Editor of the *British Medical Journal*. A preface is contributed by Mr. H. G. Wells.

THE INSURANCE MEDICAL SERVICE WEEK BY WEEK

Units of Credit

A question at the last meeting of the London Insurance Committee, arising out of the statement that the payment of doctors for the year 1936 would amount to 9s. 2.5254d per unit of credit, brought a reply from the Chairman of the Medical Benefit Subcommittee which he not unreasonably asked permission to read. The questioner and the committee were treated to an elaborate exposition of the constitution of the Central Practitioners Fund its distribution between areas, and further distribution to doctors in each area. This was followed by an exhaustive supplementary question, which showed that the questioner had failed to grasp the real content of the discourse to which he had listened. The inquiry was prompted by the fact that the capitation fee was 9s., why therefore 9s. 2.5254d? It was not the four places of decimals which mystified the inquirer, but the 2½d excess over the 9s. In other years when the payment had fallen short of 9s. it does not appear that any member of the committee was prompted to investigate.

Most practitioners know by this time that owing to the day-to-day movements of the insured population no payment can be made of an agreed capitation fee on the count of the doctors' lists. The only true record necessarily approximate, of the insured population can be made by an actuary who takes as his basis the stamp sales for the year, and then makes a series of mysterious calculations designed to secure that the doctors in the country as a whole receive their full payment. In the distribution of this central pool so calculated the Ministry has the advice and assistance of a distribution committee upon which the medical profession is well represented. A distribution having been made between the several insurance committee areas, the doctors within each area are paid quarterly their respective proportions of the pool for that area according to the quarterly count of the number of persons on their lists.

In London some years ago there was an extensive clearance from the doctors' registers of names of persons who had passed out of insurance and of duplicate names, etc. This had the effect of increasing the payment for each entry on the doctors' lists, although it did not increase the total amount distributed. As there are always a certain number of persons for whom the doctors are at risk—that is, persons who have not yet found their way on to a doctor's list—the effect of smaller lists is still further to increase the payment for each separate entry, or unit of credit as it is called. Those readers who are sufficiently interested will find the whole matter described in Chapter 12 of the new edition of *Medical Insurance Practice*.

Delay in Choosing a Doctor on Removal

A very reasonable commentary on the note on this subject which appeared in the *Supplement* of March 13 (p. 131) is made by a correspondent in the *Supplement* for April 3 (p. 168). He says:

I cannot agree that the present method results in even "a rough and ready measure of equity." Various areas have different rates of expansion or contraction and the fact that say 10,000 residents enter a particular area owing to employment economics and slum clearance schemes does not mean a similar number must leave the area. In fact the total increase of insured persons in certain rapidly expanding areas may be 1,000 to 5,000 per annum over a period of years. It is not in the least equitable for the panel doctors in such areas to have only 20 to 30 per cent of this number joining their lists. Until an influenza epidemic occurs to stimulate choosing a doctor by the patient the doctor will be giving attendance to almost 100 per cent of his panel during the year.

which is not at all compatible with the theory of the standard capitation fee for both sick and well

The London Insurance Committee has an excellent scheme which if adopted by all other insurance committees would help to ameliorate the inequity. A label is affixed to each medical card issued informing the patient that he will be allotted to a doctor's list unless he chooses his own doctor within a certain period (two months I think). There would necessarily have to be good liaison between all committees to ensure that movements from one area to another were notified for action. Surely this is not too big a problem for the Insurance Acts Committee to tackle.

Taking this correspondent's last point first, it may be stated at once that the only possible liaison between insurance committees where movements of the insured population are concerned is that which is at present in operation. When an insured person makes his presence known in a new area by presenting his medical card to an insurance practitioner, who sends it to the insurance committee, the committee communicates with the insurance committee for the area from which the insured person has removed so that the transfer is made effective. With regard to the assignment of insured persons the system in London is done as effectively as possible, as shown by the following extract from the minutes of the last meeting of the committee:

On January 28 1937 we informed the committee that in accordance with the decision of the committee of October 25 1934 we had arranged to assign to the lists of local insurance practitioners 28 272 insured persons who having become entitled to medical benefit in London since July 1 1934 and who having continued to reside in the area and to be entitled to medical benefit for a period of three months or more had failed or neglected to select a method of treatment. We are now in a position to report that a further 10 378 assignments of a similar nature have been made bringing the total number of insured persons so allocated to 38 650.

There is of course no reason why a similar system should not be operative in every area so far as new entrants to insurance are concerned. But the problem of dealing with those areas where there is an abnormal increase in the insured population can only be effectively met—and is no doubt fully considered where the information is made available—by the distribution committee referred to above in its advice to the Minister as to the distribution of the central pool between areas. If the area pool is duly loaded by reason of special circumstances the proper distribution of the local pool must then be secured in the local distribution scheme.

The Improving Medical Service

In a letter in the *Supplement* of April 3 Dr F. A. L. Burges writes: "During my last year as chairman of the Birmingham Insurance Committee with a population of nearly 400 000 insured persons there were only three complaints brought before the Medical Service Subcommittee and none of these complaints was substantiated. What better proof could you have that the service was a good one and appreciated by the insured population?" It was noted in this column recently that no medical service cases during the preceding month had been presented to the Insurance Committees of London and Glasgow. An examination since made of the minutes of these two committees for the following month reveals the same interesting result.

Owing to an increase in the work of the West Middlesex County Hospital the Public Health Committee of the Middlesex County Council has recommended the appointment of three additional assistant medical officers at a salary of £400 rising by annual increments of £25 to £475 and emoluments valued at £100.

Branch and Division Meetings to be Held

FIFE BRANCH—At Station Hotel, Kirkcaldy, Thursday, April 22. Afternoon clinical meeting. Mr. J. J. Robb (Dundee). Actiology and Treatment of Duodenal Ulcer.

KENT BRANCH, BROMLEY DIVISION—Joint meeting with Bromley Medical Society at White Hart Hotel, Bromley, Wednesday, April 21, 8.45 p.m. Dr. H. Gardiner Hill. Thyrototoxicosis. Preceded by supper at 7.45 p.m.

KENT BRANCH, EAST KENT DIVISION—At Grand Hotel, Cliftonville, Thursday, April 22, 8.45 p.m. Mr. John Hosford. Modern Treatment of Fractures. Preceded by dinner at 7.40 p.m.

LANCASHIRE AND CHESHIRE BRANCH, WARRINGTON DIVISION—At Carter's Café, Bridge Street, Warrington, Thursday, April 22, 7 p.m. Annual dinner.

METROPOLITAN COUNTIES BRANCH, CAMBERWELL DIVISION—At Constance Road Institution, Tuesday, April 20, 9 p.m. Dr. H. A. Dunlop. Recent Advances in Pharmacology.

METROPOLITAN COUNTIES BRANCH, CHELSEA DIVISION—At Fulham Town Hall, Thursday, April 22, 8.30 p.m. Air raid precautions discussion. Address by Dr. N. W. Hammer.

METROPOLITAN COUNTIES BRANCH, GREENWICH AND DEPTFORD DIVISION—At Miller General Hospital, Greenwich, S.E., Tuesday, April 20, 9 p.m. Dr. H. V. Merle. Some Points in the Diagnosis and Treatment of Chest Diseases.

METROPOLITAN COUNTIES BRANCH, TOWER HAMLETS DIVISION—At Mile End Hospital, L., Friday, April 23, 3.30 p.m. Clinical meeting. Demonstration of cases by Dr. A. Randle.

NORFOLK BRANCH—At Norfolk and Norwich Hospital, Friday, April 23, 3.30 p.m. B.M.A. Lecture by Dr. W. S. C. Copeman. The Fight against Rheumatism.

NORTH OF ENGLAND BRANCH, GATESHEAD DIVISION—At White House, Tuesday, April 20. Clinical evening.

NORTH OF ENGLAND BRANCH, NEWCASTLE-ON-TYNE DIVISION—At 7 Windsor Terrace, Newcastle-on-Tyne, Tuesday, April 20, 9 p.m. Election of representatives and deputy representatives.

NORTH OF ENGLAND BRANCH, NORTH NORTHAMPTON DIVISION—At Blue Bell Hotel, Belford, Wednesday, April 21, 3 p.m. Consideration of programme for summer and autumn.

SOUTHERN BRANCH, WINCHESTER DIVISION—At Royal Hampshire County Hospital, Winchester, Wednesday, April 21, 8.15 p.m. Mr. Hugh Cairns. Recent Advances in Rheumatism.

SOUTH WESTERN BRANCH—At Bournemouth, Wednesday, April 21, 4.30 p.m. In emergency meeting.

SOUTH WEST BRANCH, CRESSWELL DIVISION—At Royal Cornwall Hospital, Truro, Tuesday, April 20, 10.15 p.m. Mr. M. J. S. G. Lecture on Rheumatism.

Election of Representative Body, 1937-8

The Council hereby gives notice that Representatives and Deputy Representatives for 1937-8 must be elected by the Constituencies (see below) not later than Saturday, May 15 and their names received at the Head Office not later than Thursday, June 3, 1937

It is a matter for the Executive Committee of the Division (or, where a Constituency comprises more than one Division, for a joint meeting of the Executives of the Divisions) to decide whether the Representative(s) and Deputy Representative(s) shall be elected by a *General Meeting* of the Constituency or by *Postal Vote*. The meeting of the Constituency must be called (and, where the election is by voting papers, these must be issued) by the Secretary of the Division (or, in the case of Constituencies comprising more Divisions than one, by the Secretary of the Division containing the largest number of Members)

I CONSTITUENCIES IN GREAT BRITAIN AND NORTHERN IRELAND

The Council has formed the Divisions in Great Britain and Northern Ireland into the Constituencies for election of the Representative Body, 1937-8, shown below

II CONSTITUENCIES IN THE IRISH FREE STATE

The Branches in the Irish Free State Medical Union (Irish Medical Association and British Medical Association) have been grouped as follows for the election of three Representatives

{ Connaught	{ Munster
{ Monaghan and Cavan	{ South Eastern of Ireland
Leinster	

III CONSTITUENCIES NOT IN GREAT BRITAIN OR IRELAND

The Council has made each Division and Division-Branch outside Great Britain and Ireland an independent Constituency

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses of proctology at Gordon Hospital April 26 to May 1, psychological Medicine at Maudsley Hospital April 26 to May 29, dermatology at St. John's Hospital May 3 to 29, thoracic surgery at Brompton Hospital May 24 to 29, infants diseases at Infants Hospital April 24 and 25, cancer at Royal Cancer Hospital April 24 and 25, chest diseases at Brompton Hospital May 8 and 9, physical medicine at St. John Clinic and Institute of Physical Medicine May 22 and 23, children's diseases at Princess Elizabeth of York Hospital May 29 and 30. Detailed syllabuses of all courses can be obtained from the Fellowship of Medicine, 1 Wimpole Street, W. The

annual dinner-dance of the Fellowship will take place on Friday May 28 at Claridge's Hotel. Tickets can be obtained from the secretary or from any member of the ladies committee. All members of the medical profession and their friends will be welcome.

A short course of lectures on leading symptoms in ophthalmology will be given in the Tennent Memorial Building Church Street, Glasgow, on Tuesdays at 5 p.m. from April 20 to May 18 both dates inclusive. The course has been arranged by the Department of Ophthalmology of the University of Glasgow and the Principal Sir Hector J. W. Hetherington will give a short introductory address on the occasion of the first lecture of the series.

WEEKLY POST-GRADUATE DIARY

BRITISH POST-GRADUATE MEDICAL SCHOOL Ducane Road W.—Daily 10 a.m. to 4 p.m., Medical Clinics, Surgical Clinics and Operations, Obstetrical and Gynaecological Clinics and Operations. *Mon* 2.30 p.m. Dr C. W. Buckley Arthritis. *Tues* 12 noon Clinical and Pathological Conference (Medical). 2.30 p.m. Dr J. Vaughan Sedimentation Rate. 3 p.m. Clinical and Pathological Conference (Surgical). 4 p.m. Mr J. E. H. Roberts Surgery of the Chest. 4.30 p.m. Dr W. E. Gye Experimental Cancer Research. *Thurs* 2.30 p.m. Dr Duncan White Radiological Demonstration. 3.30 p.m. Mr A. K. Henry Demonstrations on the Cadaver of Surgical Exposures. 3.30 p.m. Mr Malcolm Donaldson Radiation Therapy in Gynaecology. *Fri* 2 p.m. Operative Obstetrics. 3 p.m., Clinical and Pathological Conference (Obstetrical and Gynaecological).

FELLOWSHIP OF MEDICINE AND POST-GRADUATE MEDICAL ASSOCIATION, 1, Wimpole Street W.—*West End Hospital for Nervous Diseases* Welbeck Street W. All-day Course in Neurology. *Infants Hospital* Vincent Square SW. Sat and Sun., Course in Infants Diseases. *Royal Cancer Hospital* Fulham Road SW. Sat and Sun. Course in Cancer.

CENTRAL LONDON THROAT, NOSE AND EAR HOSPITAL Gray's Inn Road W.C.—Daily Course in Anatomy and Physiology.

HOSPITAL FOR EPILEPSY AND PARALYSIS Maida Vale W.—*Thurs* 3 p.m. Dr W. G. Wyllie Clinical Demonstration.

HOSPITAL FOR SICK CHILDREN Great Ormond Street W.C.—*Thurs* 2 p.m. Clinical Lecture. Sir Lancelot Barrington Ward Developmental Abnormalities of the Mesentery and Gut. 3 p.m. Clinicopathological Lecture. Dr Bertram Shires Slagographic Appearances in Rickets, Scurvy etc. Out-patient Clinics mornings 10 a.m. to 12 noon. Ward Visits afternoons 2 p.m. to 3.30 p.m.

INSTITUTE OF MEDICAL PSYCHOLOGY Malet Place, W.C.—*Mon* 5.45 p.m., Dr Emanuel Miller Mental Dynamics—the Unconscious. *Tues* 11 a.m. and *Thurs* 8.30 p.m. Prof E. Kretschmer (Marburg). (1) Heredity and Constitution in the Aetiology of Psychic Disorders. (2) The Structure of the Personality in Relation to Psychotherapy. (3) Insulin and Hysteria. *Thurs* 3 p.m. Dr H. Crichton Miller Enuresis Nocturna. 4.20 p.m. Dr Cedric Shaw Physical and Psychic Factors in Symptom Formation. 5.45 p.m. Dr Miller Personality Types.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART Westmoreland Street W.—*Tues* 5.20 p.m. Dr B. T. Parsons Smith Right Heart Failure.

ST JOHN CLINIC AND INSTITUTE OF PHYSICAL MEDICINE Ranelagh Road SW.—*Fri* 4.0 p.m. Demonstrations of various methods of physical treatment at the Rheumatic Unit at St. Stephen's Hospital.

WEST LONDON HOSPITAL POST-GRADUATE COLLEGE Hammersmith W.—Daily 2 p.m. Operations, Medical and Surgical Clinics. *Mon* 10 a.m. Dr Post. A Ray Film Demonstration. Skin Clinic. 11 a.m. Surgical Wards. 2 p.m. Surgical and Gynaecological Wards. Eye and Gynaecological Clinics. 4.15 p.m. Mr Green Armistage Endometrioma. *Tues* 10 a.m. Medical Wards. 11 a.m. Surgical Wards. 2 p.m. Throat Clinic. 4.15 p.m. Mr Wood Walker Adhesions around Joints. 11 a.m. Children's Ward and Clinic. 11 a.m. Medical Wards. 2 p.m. Eye Clinic. Gynaecological Operations. 4.15 p.m. Mr Hasler Lie anaesthetic Medication. *Thurs* 10 a.m. Neurological and Gynaecological Clinics. 12 noon Fracture Clinic. 2 p.m. Eye and Genito-Urinary Clinics. *Fri* 10 a.m. Medical Wards. Skin Clinic. 12 noon Lecture on Treatment. 2 p.m. Throat Clinic. Sat. Children's and Surgical Clinics. 11 a.m. Medical Wards. The lectures at 4.15 p.m. are open to all medical practitioners without fee.

ALFRED MEDICAL SCHOOL—At Aberdeen Royal Infirmary. *Tues* 3.15 p.m., Prof I. S. P. Davidson Investigation and Treatment of a Case of Jaundice. *Thurs* 3.15 p.m. Prof I. S. P. Davidson Investigation and Treatment of the Hemorrhagic Disease.

BIRMINGHAM UNIVERSITY—At Medical Faculty Buildings, Edmundo Street. *Thurs* 4 p.m. William Withering Lecture. F. I. of W. N. Haworth F.R.S. Chemistry of the Carbohydrates. Ascorbic Acid and Other Water-Soluble Vitamins.

GLASGOW POST-GRADUATE MEDICAL ASSOCIATION—At Western Infirmary. *Tues* 4.15 p.m. Dr J. G. M. Macgregor Role of Venereal Disease in Men.

GLASGOW UNIVERSITY—At Tennent Memorial Building Church Street Glasgow. *Tues* 5 p.m. Prof A. J. Ballantine Vascular Defects of Gradual and Sudden Onset. Preceded by a short introductory address by Sir Hector J. W. Hetherington.

MANCHESTER ROYAL INFIRMARY—*Tues* 4.15 p.m. Mr G. J. G. Jefferson Surgery of Intracranial Aneurysms. *Fri* 4.15 p.m. Dr Crichton Bramwell, Demonstration of Medical Case.

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE

General Meeting of Fellows *Tues* 5.30 p.m. Ballot for Election to the Fellowship.

Section of Neurology—*Thurs* 8.30 p.m. Pathological Meeting. Specimens will be shown.

Section of Urology—*Thurs* 10 a.m. Annual General Meeting. Election of Officers and Council for 1947-8. Papers by Mr Clifford Morson The Harris Operation and its Modification. Mr Kenneth Walker Transurethral Operations on the Prostate Gland. 9.30 a.m. to 1.30 p.m. Exhibition of Urological Instruments. 2.30 p.m. Meeting at Royal College of Surgeons. Demonstration of Museum Specimens and Report of Experimental Urinary Work. 8 p.m., Dinner at Langham Hotel. *Fri* 10.15 a.m. Papers by Sir John Thomson Walker The Bladder in Spinal Injuries in War. Prof G. Grey Turner The Place of Surgery in the Undescended Testicle. 2.30 p.m. Operations and Demonstrations at All Saints Hospital, St. Paul's Hospital, St. Peter's Hospital, Middlesex Hospital and King's College Hospital.

Section of Disease in Children—*Fri* 5 p.m. (Cases at 4.30 p.m.) Cases which have previously appeared before the Section will be shown.

CHITSEA CLINICAL SOCIETY—At Hotel Rembrandt, Thimble Piece SW. *Tues* 7.30 p.m. Discussion. The Doctor and his Dependents. To be opened by Mr E. Rock Carling.

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which must be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

BIRTH

- GRANT NICOL—On April 8 to Greta wife of Dr C. Grant Nicol of Carshalton a daughter

DEATHS

- BOOYSEN—On April 7 after a short illness Dr Cecile Booyesen LRCP MRCS 12 Kent Terrace N.W.1 and of Graaff Reinet South Africa aged 43
JACKSON—On April 6 at a Southsea nursing home John Jule Jackson M.B. B.Ch. beloved husband of Fanny Elizabeth Jackson and son of the late Rev. John Jackson D.D. Ballycastle Interred at Rowan Hamplshire on April 8

found post mortem) died under an anaesthetic. Among the twenty-two deaths associated with pregnancy or confinement the most common cause of death was heart disease. One satisfactory feature is that among the 15 681 patients attending the Council's ante natal clinics only eight cases of eclampsia developed, with one death.

Council Hospital Finance

Figures for hospital costs, as the recent report of a Departmental Committee has shown, can be very misleading especially when they are set out as cost per patient or occupied or available bed because the circumstances of hospitals are so diverse. If such statistics might ever be expected to tally it would be in a series of hospitals all admitting the same kind of cases and all belonging to the same public authority. Yet if one takes the twenty-seven general hospitals of the London County Council for the treatment of acute medical and surgical patients, as set out in the annual report, very considerable differences are revealed. Omitting from the comparison Hammersmith Hospital where the British Post Graduate School is established and which is exceptional in many ways we find the net cost per week per occupied bed ranging from £2 9s 6d at St James Hospital Balham, to £3 9s 6d at Highgate Hospital and at Mile End. The average for the whole range of these hospitals is £3 3s 11d per week leaving out of account any charges for superannuation funds pensions or other establishment charges and annual charges in respect of capital outlay which, if they were apportioned would bring up the cost to £3 17s 7d. Of the weekly figure provisions and stimulants roughly cost 6s 4d surgery and dispensary 4s 3d medical services 4s 4d nursing services 9s 9d general domestic services 9s 11d heating and lighting 4s 11d and laundry 3s 6d. The item for medical services differs remarkably. At St Mary, Islington it is 3s 5d, and at St Pancras 5s 6d. The nursing services also cost much more at some hospitals than at others. At St Peter's the cost of the nursing service per occupied bed is 12s 5d and at St Mary Islington only 7s 10d.

The cost in fever hospitals works out at very much the same total—£3 15s 9d a week—but here again the cost varies very considerably among the nine comparable hospitals from £3 8s 8d at the North Western to £4 9s 8d at the Brook. Nursing costs at fever hospitals are heavy ranging about 2s 6d per week per bed above those at general hospitals for acute cases. The tuberculosis hospitals cost less the average for the group being just below £3 a week and in the children's hospitals the cost is lower still.

Many figures of much interest to statisticians and hospital administrators are to be found in this report. The ambulance service for example is unexpectedly costly amounting to 17s for each patient carried. The total number of articles washed at hospital laundries in a year is over 55 millions and the average cost works out at just under one penny each. The London County Council during the year ending March 31 1936 spent in salaries and wages on its hospital service £2 109 000 as compared with £1 755 000 five years ago and on medical and surgical requisites and pathological services £220 000 as compared with £137 000.

¹ London County Council Annual Report 1935 Vol. 4 (Part II) Public Health—H. P. S. King and Son (1936).

THE HEALTH OF SCOTLAND

REPORT FOR 1936

Commenting on the general health of the people of Scotland the report of the Department of Health for 1936 states

On the whole the gradual trend towards better health continues but there is cause for regret in that the low record death rate for children under 1 year attained during 1935 (76.8 per 1 000 births) was not held during 1936 when the rate rose to 82 per 1 000. High infantile and maternal death rates constitute one of the most stubborn and difficult of Scottish health problems. There is no doubt that nutrition could be further improved by supplementation of diet and other appropriate measures particularly in the case of expectant and nursing mothers and pre school children but examination of unemployed males even after prolonged periods of unemployment shows that their nutritional status, as assessed by body weight or by blood haemoglobin content is not sensibly inferior to that of the employed and does not show any progressive deterioration with duration of unemployment.

Causes of Death

The general death rate for 1936 was 13.4 as compared with 13.2 in 1935. The principal causes of death were heart disease (13 696), malignant tumours (7 907), cerebral haemorrhage (6 365), pneumonia (4 793) and tuberculosis (all forms) (3 663). The report makes special comment upon the large number of deaths of young people from heart disease of rheumatic origin year after year at least 1 000 lives are lost from this cause in Scotland. The number of deaths from tuberculosis shows a slight increase over the low record figure for 1935. Technical improvements have made possible the use of portable x-ray apparatus in areas remote from hospital facilities and for some time a portable plant has been in use in the county of Dumbarton with excellent results. There has been a gratifying increase in the care given to the supervision of active cases of tuberculosis in order to prevent their becoming sources of infection.

Infectious Diseases and Health of Children

Except for a sharp rise in the incidence of measles the prevalence of infectious diseases showed no considerable departures from the normal. In the autumn poliomyelitis was unusually prevalent especially in South East Scotland. Few of the cases came to light before the onset of paralysis but most of them received treatment in large well equipped hospitals and steps were taken to provide adequate after care. The number of school children who received medical treatment under school health schemes has increased from 210 000 in 1925-9 to 291 000 in 1935-6. The report states that although the incidence of physical defects is still too high there has been steady improvement of recent years in the general health of school children. Average weight and height has increased noticeably. In the West Central industrial belt since 1929 the percentage of children suffering from anaemia has fallen from 2.03 to 1.14 and the percentage suffering from rickets from 1.34 to 0.79. With regard to nutrition returns relating to the medical inspection of school children show that of 241 565 children examined during the year the number whose state of nutrition was classified as below average was 11 555 or 4.91 per cent, while the number classified as very bad was 5 000 or 0.18 per cent. This represents an improvement on the preceding year when

development of ante-natal and post-natal services provided by local authorities, and that a number of new maternity institutions are in course of erection or projected. There are now no fewer than 254 maternity and child welfare centres in Scotland and 1085 nurses employed by local authorities as health visitors or school nurses. Four new maternity and child welfare centres were provided during the year, and proposals were approved for five centres to replace those in which the existing accommodation was unsatisfactory.

Housing

Overcrowding in Scotland is relatively six times greater than it is in England. More than 22 per cent of Scottish houses are overcrowded and a minimum of 160 000 new houses is needed merely to relieve these conditions. Fully one-third of all the houses in Scotland are without a separate water closet and a still greater number are without a bath. The surveys carried out by local authorities under the Acts of 1930 and 1935 show that it will be necessary to provide nearly a quarter of a million houses in order to wipe out the slums and to put an end to overcrowding. Contracts for over 27 000 State assisted houses were approved by the Department during the year, an increase of 65 per cent on the total approved during 1935. Owing mainly to the difficulty of obtaining sufficient skilled labour however this increased activity was not reflected in building progress and only about 16 000 houses were actually completed during the year. In the light of the total measure of Scottish housing needs the report concludes an annual output of 16 000 houses by local authorities cannot be regarded as satisfactory.

Water Supply and Drainage

The Department held a number of conferences with local authorities during the year with a view to the establishment of regional water supply schemes under which local authorities in the same drainage area would act in combination for water supply purposes. Considerable progress has also been made with the provision of new sewerage and sewage disposal schemes and the Commissioner for the Special Areas has undertaken to give financial assistance to schemes of this nature whose capital cost totals over £120 000.

Highlands and Islands Medical Service

The Highlands and Islands Medical Service continues to operate upon established lines and approximately £78 000 was expended on this service during the year. Important developments are projected in the provision of new hospitals and good reports continue to be received of the general practitioner and nursing services provided with assistance from the Highlands and Islands Medical Assistance Fund. The aeroplane ambulance has now become a recognized means of transporting urgent cases of illness from the islands to Renfrew.

National Health Insurance

As compared with the previous year the number of persons coming within the scope of the national health insurance scheme rose from 1 933 000 to 1 967 000. Continued improvement in industrial conditions has been reflected in a considerable increase in the contribution income. There was however a large increase in the total expenditure on sickness and disablement benefits which rose from £1 762 000 in 1935 to £1 875 000 in 1936 despite the fact that the incidence of influenza was much lower in 1936 than in the previous year. The Department states that it is difficult in face of all the evidence to the contrary to believe that this increased morbidity is due to any appreciable deterioration in the health of the insured population. It is to be attributed rather to the fact that as public opinion becomes attuned to higher health standards there is an increasing readiness to stay off work during illness and a tendency to remain off longer in an effort to secure full restoration to health.

QUEEN CHARLOTTE'S HOSPITAL

PROGRESS IN RESEARCH AND REBUILDING

No. 10, Downing Street opened its doors to the friends of Queen Charlotte's Hospital on April 6, when the annual meeting took place of the National Council of the Mother-Saving Campaign. Princess MARIE LOUISE presided. The annual report, presented by Mr SEYMOUR LESLIE, stated that during the ten years that had elapsed since the first meeting of the Council over £250,000 had been raised, of which £34 000 had been found since the last meeting. The rebuilding fund now stood at £231 564. Queen Charlotte's was the only large scale combined research and treatment centre in the world for puerperal fever. Though practically unendowed and actually poor for its size Queen Charlotte's was engaged in a vitally important national research for which and for the rebuilding scheme help was badly needed.

Dr T. WATTS EDEN, senior consulting obstetric surgeon to the hospital, spoke on the progress made during the past year and the future plans. He thought that nobody acquainted with the structure in Marylebone Road would be surprised that a rebuilding programme had been undertaken. A beginning had been made by building an isolation hospital and research laboratory on a large new site at Hammersmith. Valuable scientific work, now generally recognized all over the world, had been done by the research staff. Recently there had been submitted for trial a new remedy from Germany for the treatment of puerperal fever, and during the year in which it had been tried it had given very encouraging results. The organization at Hammersmith was an ideal centre for the scientific testing of new remedies—so important if exaggerated claims were to be avoided.

A Housing Problem

The problem now before the hospital, Dr Eden continued, was that of providing accommodation for the 1 500 patients who, metaphorically speaking, were now annually turned away from its doors. The old building could neither be reconstructed nor modernized, the only solution was to rebuild. To begin by building the whole block would be completely beyond present resources, and so a definite start had been made by the erection of a portion which would provide 112 additional beds and this while not enabling the hospital completely to meet the demands made upon it, would go a long way in that direction. There was the difficulty however that when the new block was opened it would require a large staff of nurses and so for the present the top floor would have to be used for their accommodation, reducing the number of additional beds available for patients to 82. It was proposed to use some of the space to provide accommodation for patients of moderate means who could not afford ordinary nursing home fees. Small single bed wards to the number of fourteen would be reserved for patients of this class and attached to these wards there would be a special set of delivery rooms kept completely for private use. The patients would be received at a charge which would cover no more than their actual cost to the hospital. In connexion with the new hospital it would be necessary eventually to provide accommodation for a large number of students. The cost of carrying out the whole scheme would be £500 000. Dr Eden concluded with a reference to Mrs Stanley Baldwin's interest whereby Queen Charlotte's had been in a position during the past two or three years to provide the services of a skilled anaesthetist for every patient confined in the hospital. The hospital had however been in search of a method which could safely be used by midwives and with the co-operation of the British College of Obstetricians such a method had apparently been found.

Mrs BALDWIN added a tribute to the work done by the doctors and nurses at Queen Charlotte's especially for the amelioration of suffering in childbirth. She also sug-

gested that Queen Charlotte's through its ante-natal clinic should carry out experiments on the bearing of nutrition on safe maternity. It was mentioned by Mr. H. B. Stokes, secretary-superintendent of the hospital that a certain number of anaesthetic machines of the Minnitt type but incorporating improvements by Mr. Rivett and known as the Queen Charlotte's model had been distributed to the districts, and were being used by midwives with great success.

THE BOURNEMOUTH TYPHOID OUTBREAK

JUDGE COTES PREEDY'S REPORT

The following is the report by His Honour Judge D. Cotes-Preedy, K.C., M.A., LL.M., L.S.A., on the epidemic of typhoid fever in Bournemouth and neighbourhood in the late summer of 1936. We have inserted cross-headings.

Nature of the Inquiry

At the joint invitation of the boroughs of Bournemouth, Poole and Christchurch and the Anti-Typhoid League I undertook to hold an inquiry into certain allegations, criticisms and demands of the League in connexion with the outbreak of typhoid fever which occurred in the said boroughs during August and September last.

I sat at the Town Hall, Bournemouth, on February 3, 4, 5, 12 and 13, and at the conclusion of the inquiry reserved my determination of the matter. I would point out that in no sense did the inquiry proceed on formal or legal lines, and by general consent I did not strictly enforce the rules of evidence. The extensive latitude allowed to the spokesmen on behalf of the League and the disclosure of all material facts requested by me from the officials of the boroughs will I trust reassure all interested and concerned that the inquiry was exhaustive.

Previous to the sittings the Anti-Typhoid League formulated in writing certain allegations and demands, and to these the three councils replied in writing. It was mutually agreed between the contending parties that the sittings should be held *in camera* and with this decision I agreed. In consequence I feel I am able to set forth the view I have formed in a manner conducive to brevity and without detailed examination of the evidential value of the information laid before me. I trust this course will be less likely to cause distress or annoyance to any concerned or in any way inflame any scores caused by the public agitation before the inquiry was decided upon.

At the outset I would like to make it clear that it was no part of my duty to decide as to the source of the typhoid fever outbreak—this doubtless will be amply dealt with by the Ministry of Health in its forthcoming report. But the inquiry proceeded on the assumption that the source of the trouble was to be found in milk supplied by a certain dairy.

The Allegations

Mr. S. H. Wall, chief spokesman on behalf of the Anti-Typhoid League, and who discharged a difficult task with ability, insisted that the League had not come forward to emphasize private grievances. It did not seek to blame individuals but rather to condemn regulations under which the latter acted, which it contended had caused the uneasiness that existed. The vital allegations, said the speaker, relied upon by the League were that the councils, having ascertained that there were cases of typhoid in their area, had failed in

Other allegations described as important were:

- (i) that the councils should have left in their homes patients for the care and isolation of whom reasonable facilities existed in their own houses in order to be able to remove immediately to isolation hospital patients for the care and isolation of whom no reasonable facilities existed in their own homes, and that in consequence certain patients for whom no facilities existed in their homes were unable to obtain immediate admission to isolation hospitals or were compelled to undergo long journeys to isolation hospitals in other areas;
- (ii) that improper pressure was brought to bear on persons with facilities at home to induce them or persons in their charge to be removed to isolation hospitals; and
- (iii) that orders under the provisions of the Public Health Act 1875 were obtained or sought to be obtained without the necessary conditions precedent to the granting of such orders being fulfilled.

Though not set forth in the allegations and demands, Mr. Wall, in the course of his speech, alleged that the councils had concealed the true facts of the outbreak in deference to the desire of the majority of people who were financially interested in the district. He added that he did not suggest any deliberate plot by anybody in particular, but described the situation as that of an atmosphere which was created to save the towns' revenue.

Early in the inquiry it was clear that the allegations had little or no relation to the borough of Christchurch, and I was able to release the officials of that borough from participation in the inquiry.

Questions of Responsibility

In the first place it should be borne in mind that from the onset of the outbreak the responsible officials of the boroughs had the assistance and guidance of the Ministry of Health in the person of the late Dr. Shaw, the well-known epidemiological expert, whose recent death is greatly to be deplored. I am satisfied that his views and advice were accepted and acted upon by the local officials, although the latter admitted their responsibility for any orders or directions that were given.

Secondly, I would point out that it was established that the symptoms of paratyphoid and typhoid are extremely difficult to differentiate in the early days of the disease, while in addition there are certain ailments of a less serious import, such as food poisoning, which are liable to occur during the summer and autumn months and present similar symptoms at the outset.

Again, it is important to realize that the laboratory tests for paratyphoid and typhoid do not produce immediate results leading to certainty. Though perhaps of little importance, it appears that "paratyphoid" and typhoid are often eluded together under "enteric fever" in the returns of the Registrar-General, which may tend to confuse the public.

In my view once the situation was established there was no endeavour on the part of the authorities to conceal the true facts about it

Nursing in Hospital or at Home

If the charges (iv) and (v) had been in any degree supported by reliable evidence they would possibly have called for serious consideration but in my opinion there was no evidence given tending to establish such allegations. The fullest information was afforded to me showing that the sudden and serious difficulty of accommodating a large number of patients was tackled with great efficiency by the medical officers and the Health Committees.

Under the advice of the Ministry of Health's representative isolation of patients in hospital was urged and in my opinion rightly so. Naturally one is able to understand and sympathize with the feelings of anxious relatives for the patient's own home to be used but from a public welfare point of view there seems to be no doubt isolation in a hospital under strict and careful supervision is the more desirable course. It is not without interest in this connexion to note that the evidence showed that in Poole out of 197 cases treated in hospital twelve died and that of thirteen cases nursed in their own homes five died. But I do not suggest any certain deduction can be drawn from these figures.

In one case in Poole it appeared that the medical officers strongly urged upon those in charge to allow the patient to be removed which was strongly resented and that an application for a magistrate's order ordering the removal was unsuccessfully made. Apart from this case which in my view did not exhibit undue pressure no reliable testimony was forthcoming showing that such pressure had been exerted over relatives or patients themselves. From several witnesses I received favourable accounts of their treatment while in hospital.

Vindication of Officials

On reflection I feel sure that the members of the Anti-Typhoid League will share my regret that the charge was ever put forward alleging that the true facts concerning the outbreak were concealed owing to the financial interest which the majority of the inhabitants had. There was not a scintilla of evidence put forward to support such a serious allegation. Moreover I am confident no one could believe that officials responsible for the health of the community would lend themselves to such a proceeding. There were other criticisms made by the League but they were of a minor character and do not call for serious consideration.

I have no hesitation in saying that the inhabitants of the three boroughs should realize that Dr C. F. Pedley, deputy medical officer of health for Bournemouth, Dr R. J. Maule, medical officer of health for Poole, Dr Walter Asten, chairman of the Bournemouth Health Committee, and the other officials of the boroughs grappled with a sudden and serious situation with efficient vigour and a keen appreciation of the proper steps to take in order to deal with the emergency that faced them. They deserve the confidence of their fellow citizens.

In conclusion I would like to emphasize the fact that all who took part in the inquiry evinced an earnest desire to sift thoroughly all the matters in question and with the ultimate benefit of the three boroughs in mind. This heartens me to believe that any bitterness engendered before the hearing may have been permanently dispelled. I must thank all those who addressed me and others who gave me their kind assistance during the inquiry.

D. COTES PREDD

April 4 1937

In Belgrade there is one doctor to every 300 inhabitants. There is a total of 789 male and 171 female practitioners. The economic conditions under these circumstances are very unfavourable, and are believed to account for the high mortality in the medical profession especially among the younger doctors.

Reports of Societies

ACTIVE IMMUNIZATION AGAINST DIPHTHERIA

At a meeting of the Section of Epidemiology and State Medicine of the Royal Society of Medicine on April 9 with Surgeon Rear-Admiral S. F. DUDLEY in the chair, a lecture was given by Dr CLAUS JENSEN, director of the department of biological standards, State Serum Institute, Copenhagen, on active immunization against diphtheria with special reference to a combined subcutaneous and intranasal method.

Dr Jensen said that it was with diffidence he spoke to an English audience on a subject on which so much excellent work had been done in this country, especially under the aegis of the Medical Research Council. In Denmark the actual number of individuals inoculated against diphtheria was relatively small owing partly to the fact that the number of cases of diphtheria had been low for some years, with no real epidemics, and also to the unwillingness of the authorities of the State Serum Institute to endorse propaganda for mass immunization until a thoroughly efficient and convenient method was available. In some countries the three-injection method of Ramon had been tried, but for mass immunization it had several drawbacks. From the point of view of practical administration it was desirable to obtain a diphtheria antigen of such marked immunizing power that a single injection would confer a sufficient degree of immunity without causing undue local or general reactions. Much work had been done in recent years towards making effective, easy and cheap this ideal of the public health administrator.

In Denmark the preparation chosen was purified toxoid with aluminium hydroxide. The toxoid used was a diphtheria toxin detoxicated by formaldehyde and heat, and put through a thorough process of purification which removed most of the unspecific more or less decomposed proteins, salts and other substances present in the crude toxoid. Before distribution the purified diphtheria toxoid was mixed with a sterile suspension of aluminium hydroxide. For details as to the properties of this substance he referred his audience to the work of Schmidt and Hansen (1933 *Acta path et microbiol Scandinavica* Suppl. 16). For active immunization by a single subcutaneous injection from 1 to 1.5 ccm of this preparation equal to 35 to 50 flocculation units of the purified toxoid stimulated antitoxin production in 96 to 98 per cent of cases. In children below 7 years of age the injection of antigen seldom caused reactions. In 82 per cent there was no reaction in 11 per cent a very slight local reaction and in 7 per cent moderate to strong local reactions or possibly some fever. Older children showed more often a mild local reaction within the first twenty-four hours after the injection, appearing as a little swelling and redness at the site or sometimes a stronger local reaction accompanied by a moderate rise of temperature. In adults such reactions were to be expected more often but they lasted as a rule only for a day or two and no serious condition resulted. The antitoxin production might begin three to four days after the injection of antigen and as early as two weeks afterwards immunity might be well developed. From experience so far gained it appeared as if the immunity to diphtheria acquired by the use of this antigen preparation lasted for a considerable time. The effect of increasing the dose up to as much as 400 flocculation units had been studied but no significant increase in response was found. Doses smaller than 35 units had not been tried.

Intranasal Instillations

Attempts to improve the effect of the single injection method by increasing the dose given had not been very

satisfactory especially from the point of view of duration of immunity in the group of patients who responded most poorly. Therefore attention had been turned to a combination of subcutaneous and intranasal methods of administration. In the first place Dr Jensen detailed some results of the use of the combined method in experiments on rabbits. The antitoxin response to nasal instillations of increasing doses of purified toxoid showed that in previously immunized rabbits when compared with rabbits untreated the nasal method acted as a potent secondary stimulus. The purified toxoid used intranasally was absorbed very readily but the effect was too poor to permit of dependence on the nasal method alone. In rabbits the single subcutaneous injection of the purified toxoid was followed four weeks later by three or six nasal instillations at stated intervals and this was found to produce even in otherwise poor responders an excellent effect and duration. The toxoid could be given intranasally without risk in big doses and could be applied at the most opportune moment. Even the shortening of the interval to two weeks instead of four did not prevent the nasal instillation from acting as a potent secondary stimulus. The rabbit experiments were undertaken in such a way that parallel investigations could be made in children the doses in the rabbits being fixed in most cases at one tenth of the dose intended to be used in the human subject. For both the subcutaneous injection and the nasal instillation preparations of the highly purified toxoid were used but for the nasal drops the diphtheria prophylactic was more diluted. Dr Jensen showed tables indicating the good and uniform response in groups of rabbits.

Clinical Experience

The investigation was then transferred to large groups of children in Copenhagen institutions and to nurses. It was shown again that the protection against diphtheria afforded by a single injection under the skin of the purified diphtheria prophylactic with aluminium hydroxide was reinforced and prolonged considerably when four weeks after the injection the children were given a few drops of a highly purified and diluted prophylactic intranasally. This treatment was repeated one week later and two weeks later so that each child received three instillations altogether. The result showed that the group of poor responders were transformed into good ones. In at least 96 per cent of the cases the antitoxin production was 0.1 unit or more six weeks after the injection and nasal reimmunization one year later gave a still better response. The reactions to the original injection were as already indicated but there were no reactions to the intranasal instillations.

In the next place 596 probationers were examined and thanks to their generous co-operation three different methods of immunization were tried. Some were subjected to exclusively nasal instillation of the purified toxoid others received repeated subcutaneous injections of Schmidt's toxoid and 319 were immunized by the combined method the dosage being the same as for the children—namely for the injection 1 to 1.5 ccm of the purified toxoid with 10 volumes per cent of the aluminium hydroxide, followed, after an interval of four weeks by three or six nasal instillations (25 flocculation units) at stated intervals. Antitoxin production in 94 per cent was more than 0.01 unit, and in 85 per cent it was more than 0.1 unit only 1 per cent of the cases were refractory. In rare cases there were reactions to the intranasal instillations in the shape of transitory headache, nausea, or fatigue.

Emergency Prophylaxis

These investigations had shown that it was possible to obtain very considerable immunity by purified Schmidt toxoid, one subcutaneous injection being followed by

three intranasal instillations. This method had now been made obligatory for nurses in one of the large Danish hospitals. He was aware that the social and economic conditions in Denmark could not be compared with those in England but in his country, in institutions such as schools the practical administration of such a procedure was quite easy to arrange collectively, and in the family, in most cases the instillation could be given by the child's mother after instruction. In infants and children up to 2 or 3 years of age the nasal instillations could easily be administered during sleep. He was convinced that intranasal applications as a harmless means of reviving and prolonging the active immunity to diphtheria conferred by the subcutaneous injection could be the subject of successful propaganda. The method avoided the necessity for more than one subcutaneous injection, and consequently the child was spared possible reactions. He strongly recommended that in children below 6 years of age the nasal instillations should be repeated every year in September and at the beginning of and during a diphtheria epidemic, this applied also to older children who previously had been immunized as the protection against diphtheria was in this way reinforced and prolonged.

While immunization by the nasal route alone gave a poor result and should not usually be relied on, yet in emergency prophylaxis at the outbreak of a diphtheria epidemic it had a role to fulfil. Dr Jensen gave the following scheme for emergency prophylaxis.

1 Individuals not immunized previously

(i) immediate passive immunization of all possible contacts (members of households, institutions, schools, etc. where cases had occurred) by anti-diphtheric serum from goat or sheep dosage 600 units in children up to 5 years 1,000 units in children up to 10 years and 1,500 units in older children and adults given intramuscularly.

(ii) Simultaneous combined subcutaneous and intranasal immunization according to the method already set out but with an interval of only two weeks between the single injection and the first nasal dose.

(iii) Nasal immunization of specially exposed children above 15 years of age and adults by nasal instillations six applications of 25 flocculation units over a period of twelve days.

2 Individuals immunized previously immediate nasal re-instillations at all ages

Discussion

The brief ensuing discussion was mostly in the nature of compliment to Dr Jensen and his fellow workers. Surgeon Rear Admiral DUXLEY said that if it was worth while to protect the country from diphtheria it was worth while maintaining the immunity and to do that it was necessary to reinforce it at various periods after the original injection. He thought that from the point of view of the public health services it would be of great advantage to be able to follow up the primary injections by nasal instillations—though perhaps the mothers should not be trusted with the procedure as they were in Denmark. This purified aluminium toxoid seemed to have less objections to it than some other preparations. Professor W. W. JAMESON thought the method would be feasible with the staff of health visitors such as local authorities possessed. Dr ALEXANDER JOE expressed some scepticism about nasal immunization. Sir HENRY DALE cited the parallel of insulin. He agreed as to the difficulty of putting these procedures into the hands of parents. On the other hand who would have supposed some fifteen years ago that there would now be thousands of people of all classes in this country injecting themselves safely two or three times a day with insulin? If this could be done successfully with one preparation it might be done with another.

LOBECTOMY AND BRONCHOSCOPY

At a meeting of the Liverpool Medical Institution on March 18, with the president Professor R E KELLY in the chair, Mr HUGH REID read a paper on lobectomy.

Mr Reid said that he proposed to outline the common indications for and the complications following lobectomy, and to describe the technique which was illustrated by means of a colour film. Only recently had the mortality following this operation been so lowered as to bring it within the sphere of practical surgery. Brunn described the one stage operation in 1929 and although various refinements had been added his fundamental principles had not been altered, this was the method adopted by the speaker. It was pointed out, however, that the one stage operation had not been accepted by everyone for every case of lobectomy. Alexander, for instance made out a very good case for the two stage method, particularly as regards complications. The technique of the operation was then described in detail and the various complications which might ensue were discussed. Mr Reid said that the greatest field for the operation was in bronchiectasis and in carcinoma of the lung. Regarding the fate of the cavity left after the operation and the reaction of the remaining lobe or lung, it had been shown that if the whole lung was removed from one side the hemithorax filled up with a reticulated fibrin while the remaining lung increased in size by hyperplasia and hypertrophy without emphysema and the mediastinum was pushed over, the ribs on the affected side falling in, and the diaphragm rising in an attempt to obliterate the cavity. If only one lobe was removed it was surprising to notice that after a few days the remaining part of the lung had enlarged to obliterate the cavity completely.

The Time to Operate

In the discussion which followed Dr N B CAPON spoke of the great benefit which a patient of his had received from the operation described, and referred to other cases in which still more extensive lobectomy had been successfully performed. The cases required careful diagnosis and selection with full investigation of the supposedly unaffected lobes in order to avoid disappointments. A satisfactory course of medical treatment with postural drainage should be given a thorough trial before operation was undertaken. The ideal was, of course, to prevent bronchiectasis whenever possible, and more positive efforts should be made to attain this.

Dr ROBERT COOPE agreed that to advise lobectomy was a serious responsibility. The physician in charge of a patient with bronchiectasis was in a difficulty. On the one hand, the operation was a severe one with a high risk though surgeons skilled in lung surgery were now achieving far better results especially in the young with the development of their technique. On the other hand, the natural history of the disease made it certain that many a patient with bronchiectasis though reasonably well at the moment, would in perhaps five seven or ten years time be a distress to himself and to those about him. To wait until the patient and his friends were desperate before advising operation was fair to neither patient nor surgeon. By that time an originally unilateral bronchiectasis might have become bilateral widespread damage to the lungs might have occurred and in any case the patient would be a poor subject for surgery. If operation was to offer any chance of cure someone with expert knowledge of the disease had the duty of advising it after full careful and unhurried consideration at a time when the patient was fit enough to have a good chance of recovery from an extremely severe operation. That was at a time when there was a temptation to carry on with merely palliative treatment for while the doctor knew the course and prognosis of the disease the patient and his friends could hardly be expected to grasp it. With the modern advance in lung surgery the physician could feel reasonably happy in passing on young and otherwise

healthy subjects to the competent thoracic surgeon, where older patients were concerned there was still need for the utmost caution in weighing up the pros and cons of surgical treatment with a bias at present against it. In spite of occasional recorded cases of lobectomy or total pneumonectomy for bronchial carcinoma both physicians and surgeons would agree from actual experience that the number of cases suitable for this procedure must be very few indeed.

Mr H V FORSTER said that Frenckner of Stockholm had described a close fitting bronchial catheter and an ingenious instrument called the "spiropulsator" which could be used for producing positive pressure narcosis in one lung alone. These instruments might be of use in the operation of lobectomy or pneumonectomy. The laryngologist had been a pioneer in the study of lung disease by bronchoscopy but he saw how these aids were now being employed by the physicians or surgeons themselves. Possibly the bronchoscopist by helping to avoid pulmonary atelectasis in children would be able to contribute to the prevention of established bronchiectasis.

Bronchoscopic Clinics

Mr J E G MCGIBBON and Dr E T BAKER BATES contributed a joint paper on the value of a bronchoscopic clinic. The necessity and difficulties of accurate diagnosis in certain cases of pulmonary disease, even after the most careful clinical examination and investigation, was stressed. The fact that the bronchoscope which was originally employed forty years ago, was very little utilized owing to the special technique required the need for team work and the fact that it lay between the province of the laryngologist and chest physician, were also noted. If bronchoscopy was properly carried out under local anaesthesia it was a safe and harmless procedure even in the presence of serious lung disease. The work of and the methods employed at the bronchoscopic clinic of the Royal Southern Hospital Liverpool were then reviewed. The number of foreign body cases was small. Suspected bronchial neoplasm pulmonary suppuration as in bronchiectasis and lung abscess, dyspnoea due to tracheal and bronchial obstruction, collapse of the lung, recurrent haemoptysis of obscure origin, and certain doubtful cases of asthma, all called for bronchoscopic inspection and appropriate treatment when possible, and formed the bulk of the work of the clinic. Foreign bodies were classified as radiologically opaque and radiologically non-opaque and with regard to their composition as organic and inorganic. The clinical features of these types were described. The organic foreign bodies were dramatic and serious, and called for immediate removal. Several cases of non-opaque organic foreign bodies were encountered which had previously been thought to be lung abscess, unresolved pneumonia and new growth. Bronchoscopy revealed an unsuspected foreign body, removal of which brought about resolution of the lung condition and cessation of symptoms in the majority of cases. The necessity for careful investigation whenever possible by direct and lipiodol x-ray examination was emphasized. A further point was that undue haste in attempts at unskilled removal proved as great a source of danger as the foreign body itself.

Pulmonary suppuration in the widest sense was next discussed. It was necessary to examine with the bronchoscope all cases of unresolved pneumonia localized non-tuberculous pulmonary fibrosis lung abscess and bronchiectasis in order to exclude suppuration and pneumonitis distal to simple and malignant bronchial new growths and foreign bodies. The existence of true unresolved pneumonia and localized non-tuberculous pulmonary fibrosis was rare in their experience and in most cases referred to the clinic with this diagnosis an aetiological factor such as a foreign body or new growth had been found. The diagnosis of unresolved pneumonia or localized pulmonary fibrosis should only be accepted with caution after a process of exclusion especially in the adult. The results of broncho-

scopic aspiration and failure in chronic lung abscess and bronchiectasis were in their experience disappointing and no better than that obtained by postural drainage when properly carried out.

Simple new growths were rare. All cases discovered during life had been revealed by bronchoscopy and what had been thought to be an extremely rare condition might prove to have a much higher incidence when bronchoscopy was more generally employed in obscure lung lesions. The majority of these growths were curable by endoscopic methods: simple removal, diathermy and radium—if left untreated they ultimately gave rise to serious secondary effects. Angiomata and fibromata had been seen and treated successfully at the clinic. Malignant bronchial new growths were common by bronchoscopy; the diagnosis of these cases could be made beyond doubt. In cases with suppuration distal to a bronchial occlusion by growth dilatation with bougies of a carcinomatous stricture, removal of exuberant portions of growth by biting forceps and the introduction of radon seeds or a radon tube in certain cases lead to re-aeration of the collapsed portion of lung and drainage of secretions. By such means the complicating suppurative lesion was usually relieved, the toxæmia lessened and the sufferings of the patient minimized. Cure of course was impossible at this stage and probably would remain so in view of the situation of the growth and its mode of spread into the lung parenchyma and mediastinum.

The early cases of bronchial carcinoma were next discussed—the clinical and radiological findings were negative and the patients looked well. Recurrent hæmoptysis was the presenting symptom. If any successful treatment were possible for this terrible condition its success would depend on early diagnosis and for this bronchoscopy was essential. A case suitable for lobectomy had not yet been seen. In some cases the diagnosis of malignant disease had been disproved by bronchoscopy and foreign bodies removed. The value of the method of examination in obscure hæmoptysis was illustrated. Except in cases of emergency bronchoscopic examination should always be preceded by complete clinical and radiological examination including lipiodol bronchography. The cases should be followed up so that the significance of unusual findings might be assessed as it was not always possible to remove suitable fragments for pathological examination. Bronchoscopy would always mean teamwork, necessitating the closest liaison between laryngologist, physician and radiologist in a well equipped clinic to which cases would be sent from a wide area. The paper was illustrated by radiographs, bronchoscopic reproductions and a cinematograph film of the technique of the commoner bronchoscopic procedures.

General Discussion

In the discussion which followed Mr H. V. FORSTER said that only on one occasion had he seen a peanut removed from a bronchus and the patient died. He used to wonder why so many peanut inhalation accidents occurred in America until he was informed that peanut eating gymnastics formed part of the expression of excitement of spectators at baseball matches. He agreed with Dr Baker Bates that an inhaled tooth was also a particularly undesirable type of foreign body. He would like to understand better the value of diathermy cautery as used in a bronchus when compared with the insertion of radon seeds in cases where the obstructing growth had not been proved to be malignant. Some cases after operations on the upper abdomen by the general surgeon used to develop either pneumonia at least in his early student days. The inhibition of diaphragmatic respiration had something to do with this. The laryngologist rarely saw such complications in spite of the greater danger in his operations of inhalation of blood and secretions. He had not met a case of lung abscess after such operations in the practice of his teachers and fortunately so far had been spared this complication in his own

Further, he had found the asthmatic patient stood ether narcosis wonderfully well, though he had seen an asthmatic paroxysm take place under nitrous oxide.

Mr COURTENAY YORKE said that in his opinion the principal use of the bronchoscope would always be for the removal of foreign bodies of which very many were not opaque to x rays and were quite unsuspected. He felt dubious as to the value of radon seeds in the treatment of bronchial carcinoma. The inaccessibility of the lower edge of the growth and the limitations of radon seeds, both in range and in duration of action made him feel that on balance the possible temporary relief would hardly outweigh the risk and discomfort involved in their insertion. He referred to the fact that malignant disease in the larynx was a hundred times commoner in men than in women and thought on that account an inquiry as to the relative sex incidence in bronchial carcinoma would be very interesting and might raise important questions in regard to aetiology. Dr V. COTTON CORNWALL said that in investigating the cause of hæmoptysis bronchoscopy was sometimes the only means by which a correct diagnosis could be made. He quoted a case at Fazakerley Sanatorium where all investigations, including bronchography had been negative and bronchoscopy revealed a bronchial carcinoma.

STONE IN THE UPPER RENAL TRACT

At a meeting of the Section of Surgery of the Royal Academy of Medicine in Ireland on March 12 with the president Mr A. A. McCONNELL in the chair, Mr J. SWIFT JOLY read a paper on the treatment of stone in the upper urinary tract.

Mr Joly began by pointing out that no general rule could be laid down: each case must be judged separately, and the treatment be suited to the conditions found. He described four conditions: aseptic lithiasis, infected lithiasis, bilateral stone and calculous anuria. In aseptic lithiasis the stone was usually small, round and single and commonly composed of calcium oxalate—it was found in a kidney the function of which was well preserved until impaction in the pelvis occurred, when the stone became triangular in shape and renal function was impaired. For the removal of this type of stone the most suitable operation was pyelotomy. The rarity of branched calculi in cases where the urine was sterile was mentioned: the only example of this had been a cystine calculus. The danger of attempting pyelotomy was stressed in cases where for various reasons proper access could not be gained to the pelvis. The treatment of ureteric calculi was discussed and valuable rules for their management laid down: wounds in the ureters and pelvis were always sutured in these cases. Infected lithiasis was more serious when of the coecal type rather than when due to *B. coli* while a proteus infection was the worst; the reasons for this grading were given. With good function and mild infection removal of the stone was advisable. When the kidney was severely damaged and its fellow was uninfected Mr Joly favoured nephrectomy, and indicated the importance of Hinman's law of renal counter-balance. In cases of bilateral infection, in addition to removal of the stone the value of temporary nephrostomy was emphasized. He again mentioned the value of Hinman's law in speaking of bilateral stone and stressed the need for operating on the second side as soon as possible after the first operation. In calculous anuria he advised as a first step in all cases an attempt to pass a ureteric catheter. If this proved successful the cases could be thoroughly examined and a set operation be planned and performed under good conditions. If catheterization failed temporary nephrostomy should be performed on the side thought to be last obstructed.

Sir ARTHUR BALL said that the question of recurrence of stone had always been an anxious one, but he thought that this was only likely in infected kidneys. In one

case in which he had practised the incision advocated by Mr Joly a very unpleasant secondary haemorrhage had occurred. Mr T J D LANE said that he was sceptical of a report of the presence of *Staphylococcus albus* when the urine was clear. Professor H S MEADE referred to cases of stone in the lower end of the ureter and to the advisability of removing the kidney in infected cases with very poor kidney function. He mentioned a case in which the whole kidney was a mass of calcareous deposit.

Mr J H COOLICAN said that it was difficult to know how far to carry investigation in cases where a suspicion of renal stone arose but in which there was not much clinical evidence. Mr J C FLOOD doubted the justifiability of retrograde pyelography in the absence of infection in one kidney. It seemed to him that there was some doubt about the law of renal counterbalance. Dr G C DOCKERAY referred to the occasional difficulty in deciding on operation. Mr SETON PRINGLE thought it difficult to understand how a kidney could contain a stone as large as the one which Mr Joly had shown and yet remain aseptic when a stone had been present for any length of time he always considered it septic.

At the March meeting of the Society of Public Analysts and Other Analytical Chemists with the president Dr G Roche Lynch in the chair, a paper on the properties of calciferol was contributed by Messrs F W Anderson, A L Bacharach, and E Lester Smith. In this the physico-chemical properties of seventy three samples of calciferol prepared under standardized conditions were reviewed. It was suggested that the melting point should be described as 'unsharp 116° C'. Nearly 80 per cent of the figures for specific absorption in the ultra violet region fell within the anticipated range based on experimental error but the figures for optical rotation showed unexplained deviations outside the expected range. Nevertheless all the samples fell well within the range laid down in the 1936 Addendum to the *British Pharmacopoeia* 1932 and in the authors' opinion that range was unnecessarily wide.

M. Pepere (*Arch. ital. Chir.* vol 45 Fasc 1, 1937, p 57) as the result of experiments on rabbits comes to the following conclusions. Apart from other morbid factors which may affect it the blood pressure during operations is directly dependent on the type of anaesthetic employed, the gravity of the operation and the site where it is performed. Of the various types of anaesthesia the local regional type causes the least change in pressure while all the others cause a fall of pressure which may or may not be preceded by a temporary hypertension. There is a considerable hypotension following splanchnic and spinal anaesthesia which is less marked in the case of ether than of avertin. The operations which are chiefly responsible for hypotension are those conducted on the abdominal viscera especially those situated in the neighbourhood of sensitive nerve centres. Laparotomy in itself when the intestines are exposed to the air but are still contained in the abdominal cavity does not cause any appreciable change in the blood pressure whatever anaesthesia is employed whereas manipulation and evisceration of the intestines under local anaesthesia causes a sudden and considerable rise of pressure followed by more or less hypotension. Traction on the stomach, liver and kidneys causes a rapid and considerable fall of pressure which may last for a certain period after the stimulation has ceased. Operations on the thorax and especially on the pleural cavity cause a fall of pressure which may prove fatal. Trephining of the parietal bone under local anaesthesia causes an appreciable fall but not a state of hypotension amounting to shock. Operations on the true pelvis cause only a very slight change except when they are prolonged and necessitate traction on the intestines and mesentery.

Local News

ENGLAND AND WALES

Welsh Temple of Peace and Health

On April 8 Viscount Halifax, Lord Privy Seal, laid the foundation stone of the Welsh National Temple of Peace and Health in Cathays Park, Cardiff. The site was presented by the Cardiff City Council and Lord Davies has given the munificent sum of £60,000 for the erection of the building. It will accommodate the administrative staff of the King Edward VII Welsh National Memorial Association founded by Lord Davies for the prevention, treatment and eradication of tuberculosis in Wales, and it will also serve as the headquarters of the Welsh Council of the League of Nations Union. In the course of his address Lord Halifax said that the new building would symbolize the dedication of thought to two great purposes—national health and international peace—and he dwelt on the important part occupied by public health in enabling the people of this country to discharge worthily the duties of citizenship. Lord Davies remarked that as Welshmen they might well feel proud that the first edifice specifically designed and built in this country and dedicated to the cause of international justice and peace would be erected on Welsh soil. After the ceremony a luncheon party was given by the Lord Mayor of Cardiff in the City Hall.

Extensions at Devonshire Hospital, Buxton

The Devonshire Royal Hospital, Buxton, the dome of which was said to be the largest unsupported span in existence, has decided upon a large programme of further development. This includes the extension of the thermal departments, with additional bathing accommodation and rest rooms, new wards for cases requiring prolonged treatment, more adequate reception and consulting rooms, and the modernization of the existing building. The cost is estimated at from £30,000 to £35,000, and an appeal is made on the ground of the great work—national, not local in character—which the hospital has done during nearly eighty years, and—a point to which Lord Horder draws attention in a foreword to the brochure which has been issued—its value as a unit for treatment and research should the National Campaign against Rheumatism be successful. This hospital of 300 beds the largest of its kind in the kingdom, treats some 4,000 patients annually, and the number of treatments—thermal, massage and electrical—administered every year is close upon 100,000. It is intended for cases of rheumatism subacute and chronic, gout, sciatica, and neuritis in all their forms, fibrositis, rheumatoid and osteo arthritis, spondylitis, and crippling conditions arising from these diseases or from strains, fractures and other causes all of which are capable of being benefited by the Buxton waters. An annual report of the hospital for 1867 recently came into our hands. This was nine years after the hospital was built or rather adapted to hospital use from a range of magnificent ducal stables. There it was stated that during its first nine years 9,574 patients had been under treatment of whom 8,460 had been treated beneficially. Six sevenths of the cases were of some form of rheumatism the others being such as are ordinarily met with in hospitals. More than 8,000 cases of rheumatism embracing every single variety of this obstinate disease were extensively relieved by the remedial agency of the Buxton mineral waters. The following interesting remark is added: 'The great cost of the hospital is due to the unrestricted dietary of animal food and to the general excellence of the food that is provided and the amount of benefit afforded must be partly referred to this circumstance aiding by so much as this must do the valuable.

medicinal effect of the air of the mountain limestone and the restorative and curative power of the nitrogenous and saline waters. The number of patients benefited since then has been multiplied twentyfold and the opportunities before the hospital are greater than ever given the public support which it deserves.

Central Midwives Board

The Central Midwives Board for England and Wales has unanimously re-elected Sir Comyns Berkeley as its chairman for the year ending March 31, 1938. Mr John Bright Banister consulting obstetric surgeon to Queen Charlotte's Hospital and obstetric physician to Charing Cross Hospital and Mr Eardley Holland obstetric and gynaecological surgeon to the London Hospital have been appointed to fill vacancies in the membership of the Board. The remaining members all of whom have been re-appointed until March 31, 1938 are Counsellor R. W. Brose, Dr J. J. Buchan, Miss K. V. B. Conti, Dr W. Allen Daley, Miss A. Davies, Miss E. E. Greaves, Mr A. B. MacLachlan, Miss A. A. I. Pollard, Lady Richmond, Miss K. J. Stephenson and Mr Arnold Walker.

Rheumatism Research in Leeds

The second annual report of the Leeds Advisory Committee on Research into Rheumatism contains a reference to a new appointment made by the Leeds Public Dispensary and Hospital where members of the honorary staff have been actively working for some time on investigations. A full-time research post has been instituted there and Dr William Goldie who holds it has been granted by the University the status of research fellow. Dr Douglas H. Collins the research Fellow of the Advisory Committee was sent by it to the United States for four months in 1936 to conduct an extended tour of the medical centres in that country where the rheumatic diseases are being specially studied and treated. He has now been given charge of ten beds in the Harrogate Royal Bath Hospital in order to conduct detailed investigations into methods of treatment. In the present report Dr Collins stresses the importance of basing the investigation of rheumatism and chronic arthritis on an indisputable pathological basis. He remarks that the development of this side of the work demands some new apparatus and further technical assistance for the specialized pathological examination of bones and joints. Papers on these and kindred topics have been read to medical societies during the period under review.

SCOTLAND

Discoverer of Ether Anaesthesia

A bronze memorial plaque to Crawford Williamson Long, the reputed discoverer of ether anaesthesia was presented on March 30 to the Royal College of Surgeons of Edinburgh by the Southern Society of Clinical Surgeons, U.S.A. The presentation was made by the United States Consul in Edinburgh, and the plaque bears a bas-relief of Dr Long with the dates 1815-1878 and the inscription, "Discovered ether anaesthesia at Jefferson Georgia March 30 1842." Mr Henry Wade President of the Royal College of Surgeons who received the plaque, said that the Southern Society of Clinical Surgeons visited Edinburgh last June, under the leadership of Dr William Perrin Nicolson of Atlanta and had decided to present this memorial to the city of Edinburgh where James Young Simpson had discovered the anaesthetic properties of chloroform. Mr L. B. Wevill explained that Long at the age of 26 after he had been in practice for only a year, first used ether with the deliberate intention of abolishing pain during a surgical operation. If this had been done in some world famous clinic it would have commanded respect and admiration, but it was the achievement of an

unknown young general practitioner working in a small town over a hundred miles from the nearest railroad. It had demanded great courage on the part of both Dr Long and his patient, Mr Venable. Dr Long, after working as a student in Georgia and Kentucky had gone to Pennsylvania University, then the premier school of medicine in America and later worked in New York hospitals. Finally he settled down as a country practitioner in Jefferson, and one day he took part in a discussion about the itinerant chemists who amused gatherings by getting someone to inhale nitrous oxide or ether, and entertain the crowd with their antics. Long's friends offered to let him try it on them, and Mr Venable, who had often inhaled ether requested Dr Long to remove a wen after the inhalation of ether so that this might be done painlessly. The operation was completely successful but it was some years before the use of ether as an anaesthetic spread.

Honorary Medical Graduates

At the spring graduation ceremony of Aberdeen University on March 31, Principal W. Hamilton Fyfe presiding the degree of LL.D. was conferred among others upon Naughton Dunn M.A. M.B. Ch.B. lecturer on orthopaedic surgery in the University of Birmingham. The Dean of the Faculty of Law in submitting his name said that Mr Dunn was a graduate of Aberdeen University who had made an international name in the sphere of orthopaedic surgery and who had shown a steady devotion to the cause of the cripple. As assistant to the late Sir Robert Jones he had been intimately connected with his original scheme for orthopaedic treatment and had given unsparingly of his time, energy and skill to many hospitals concerned with this admirable purpose.

The University of Glasgow has announced that at its commemoration on June 16 it will confer honorary LL.D. degrees upon the following members of the medical profession: Jan Boeke, Professor of Histology and Embryology University of Utrecht; John Marshall Cowan physician in Glasgow; the Right Hon. Walter Elliot Secretary of State for Scotland; Thomas Kirkpatrick Monro Emeritus Professor of Medicine University of Glasgow; Sir Robert Muir, Emeritus Professor of Pathology University of Glasgow; and Ralph Stockman Emeritus Professor of Materia Medica, University of Glasgow.

Services of Glasgow Samaritan Hospital to be Extended

At the annual meeting of the Royal Samaritan Hospital for Women Glasgow Lord Rowallan who presided submitted a draft of a provisional order to enlarge the objects of the hospital. He said he believed the time had come to extend the usefulness of this hospital beyond the purely gynaecological services it rendered and to provide maternity services. Under existing legislation they could not extend the institution in that direction but they contemplated doing so in the immediate future. Professor James Henry said that there was an increasing tendency for women to seek the advantages of a hospital for their confinement. In Vienna Budapest and Stockholm 80 per cent of confinements took place in hospital in Scotland the percentage was about 30 and ten years ago it was 11. In the London County Council area 60 per cent of confinements took place in hospitals and the death rate was the lowest in England and Wales.

Birth Control Conference in Edinburgh

The National Birth Control Association of which Lord Horder is president has arranged a medical conference to be held on Friday April 30 in the hall of the British Medical Association 7 Drumsheugh Gardens Edinburgh. At the afternoon session (3 to 6 p.m.) with Dr Douglas Miller in the chair Dr Helena Wright will introduce a discussion on the "Technique of Contraception" and after this the birth control clinic at 90 East Crosscauseway will be open for inspection. The evening session

(8 to 10 p.m.) with Professor F. A. E. Crew in the chair, will be devoted to a discussion on 'Recent Advances in the Scientific Study of Chemical Contraception' introduced by Dr J. R. Baker. During the afternoon and evening the museum of contraceptives, under the direction of Professor P. S. Lelean in the Usher Institute of Public Health, Warrender Park Road, will be open for inspection. Application for tickets (price 2s for the whole conference) should be made beforehand (enclosing a postal order) to the Headquarters Organizer, N.B.C.A. (26 Eccleston Street, London, S.W.1). The conference is open to doctors and a few lay workers from birth control clinics.

Leith Hospital

At the annual meeting of contributors to Leith Hospital it was announced that £50,000 had been received towards the hospital extension fund, which aimed at collecting £60,000. The number of patients treated in the wards had been 1,897, with 18,276 out-patients. The ordinary income for the year had been £17,809, with an ordinary expenditure of £20,182 but the deficit had been amply covered by an extraordinary income of £11,512, with extraordinary expenditure of £1,120. Mr. P. H. Watson said that the extension would cover in the first place a new nurses' home and after this had been completed the medical side of the hospital would be rebuilt and would then be the most modern building of its kind in the city.

FRANCE

[FROM OUR CORRESPONDENT IN PARIS]

The *Soi-Disant* Benevolent Dispensary

At the last general meeting of the *Confédération des Syndicats Médicaux de France* there was an informative discussion about a certain type of dispensary which combines benevolence with business in that happy spirit of compromise that makes the best of both worlds. Such a dispensary on the one hand appeals to the charity of street collections, the sale of badges etc. and on the other hand charges the patients more or less substantial fees for services rendered, at the same time its benevolent side is shown to the tax collector who is expected to let such a good work enjoy fiscal immunity. It is obvious that in the competition for patients such an institution is given a running start in relation to the frankly commercial enterprise or the bona-fide dispensary serving the poor for little or no material recompense. It was decided by the *Confédération* that as from March 1, 1937 it would collaborate with the dispensaries giving free treatment exclusively to the poor and it would 'black list' this morally amphibious type of institution. The local branches of the *Confédération* will be expected to invite those of their members who are attached to these questionable dispensaries to send in their resignations failing which such doctors will be invited to appear before a body of their colleagues to explain their conduct, and if their explanations are unsatisfactory to submit to exclusion from the *Confédération*.

Tuberculosis as Seen by the General Practitioner

Reference has been made more than once in these columns to the enterprise of Dr. Godlewski, the father of the *Assises de l'Assemblée Française de Médecine Générale*, an organization for the pooling and sifting of the experiences of general practitioners throughout France. The twenty-fourth meeting of this body, presided over by Professor Bezançon, was devoted to tuberculosis in general and tuberculin skin tests in particular. The contributions of certain speakers on this subject brought out in clear contrast the behaviour of Parisians and country dwellers at the present time. Among well-to-do Parisian children not more than 12 per cent up to the age of 15 are tuberculin positive and in the country some 75 per cent

of young adults are tuberculin negative. At the other extreme there are the medical students who even at the beginning of their career are tuberculin positive eighty-eight times out of a hundred. Several speakers dealt with the danger to school children of teachers suffering from progressive tuberculosis and refusing to give up work. In this connexion a resolution was adopted recommending the employment of the tuberculin skin test in schools at least once a year among the tuberculin negative children. This task should be undertaken by the family doctor or failing him by the school medical officer. A certificate dealing with the findings of this test should be issued for each child at the beginning of each scholastic year.

Leprosy Contracted in Paris

What was described at the time as disquieting by Professor Marchoux of the Pasteur Institute was the communication made to the French Academy of Medicine on March 16 by Drs. C. Flandin and J. Ragu on the origin, mode of contagion, and incubation period in ninety-five cases of leprosy, six of which had been contracted in the Paris area. It has hitherto been taught that leprosy has long ceased to be contracted in Paris and in this connexion two alternatives may be raised. Was this notion mistaken or has leprosy again become transmissible in Paris? Drs. Flandin and Ragu incline to the latter alternative as being the more plausible. Of the six cases of leprosy contracted in Paris four represented sexual infections and so far there is nothing very strange in the development of leprosy in a bed-fellow, but in the remaining two cases the patients had merely lived at one time in a leprosy environment, one of the patients being a 26-year-old school teacher who since birth had lived in a veritable Chinese colony in the neighbourhood of Paris. It remains to be seen what will befall her class of sixty girls from whom she has but lately taken a prolonged leave of absence. When Dr. Flandin was appointed at the end of 1934 to the leprosy service of the St. Louis Hospital there were only four lepers in it. He traces the remarkable rise from four to ninety-five cases to: (1) the consideration he has shown the lepers fearful of being exhibited as curious beasts to medical students; (2) strict respect of professional secrecy and of the liberty of the individual; and (3) the success of intravenous injections of chaulmoogra cholesterol. It seems that the lepers of Paris have established an informal freemasonry among themselves, passing on to each other by unsuspected channels of communication information about therapeutic advances. It might have been supposed that most of the ninety-five patients belonged to the coloured races or were half-castes, but in fact only twenty-two of them belonged to the former category and only nine to the latter. The majority of the patients were in other words, whites who had been born in the colonies or had at least spent some time there.

Proposed Abolition of State Regulation of Prostitution

The proposal of M. Henri Sellier, Minister of Public Health, shortly to introduce a Bill to abolish the State regulation of prostitution is receiving the support of the International Abolitionist Federation. It intends to organize an international congress in Paris from May 20 to May 22—that is at the moment when important decisions will be taken in France in this matter. The congress will study the problems of prostitution and venereal disease from the legal, medical and moral points of view and the value of abolitionist principles will be put before the French public in the light of their application in Great Britain, Holland and the Scandinavian countries. Professor Paul Gemähling of the Strasbourg University and president of the French branch of the Federation will open the discussion. Dr. Veldhuyzen, director of the Wilhelmine Hospital in Amsterdam, will open the discussion on the medical aspect of prostitution. Further information about the congress may be obtained from the Secretariat of the Federation, 8 Rue de l'Hotel-de-Ville, Geneva.

Correspondence

The Factories Bill

SIR—The Factories Bill at present passing through its committee stage in the House of Commons is obviously one of the most important Bills of the session. Its provisions affect directly more than 7,000,000 people. The present Bill purports to be a consolidating measure incorporating and superseding a round dozen of previous Acts, the earliest dating from 1894. The last Act dealing specifically with factories and workshops was passed in 1901—that is, more than a generation ago. The present Bill therefore will in all probability legislate for and consequently stabilize conditions for a whole generation to come. Obviously it is of essential importance that its medical provisions be brought into line as soon as possible with medical science of the present day.

Part 1 (Health General Provisions) Part 3 (Welfare, General Provisions) Part 4 (Health Safety and Welfare, Special Provisions and Regulations) and Part 5 (Notification and Investigation of Accidents and Industrial Diseases) deal as their short titles indicate principally and indeed almost exclusively with medical questions. Part 6 (Employment of Women and Young Persons) including as it does questions of fitness, hours of employment and rest hygienic regulations etc. again is concerned with predominantly medical problems. The committee specially appointed to consider the Bill numbers seventy persons, and it bristles with lawyers but I myself am the only medical man sitting upon this committee—Major Neven Spence who was appointed a member having been obliged to absent himself from its meetings owing to his election to another committee which meets at the same hour.

I have received from many important bodies, such as the Royal Sanitary Institute, the Society of Medical Officers of Health, the National Union of Teachers, the London Teachers Association and the Industrial Welfare Society, innumerable and well-considered suggestions for altering the provisions of the Bill and as I have had a long personal experience of industrial diseases of the skin so often causing absence from work in factories I have certain modifications of my own which I should like to press. As a result I have had to put down such a number of amendments as seems inordinate for any single member to move, and partly no doubt owing to this unfortunate position amendments which I have tabled are often not called. The ignorance of medical questions and consequent apathy towards them of the average lay Member of Parliament makes it difficult for me to get support for what so many members regard as mere medical fads. The conservatism of the typical Parliamentary draughtsman springing from *vis inertiae* rather than from conviction again brings difficulties and impedes modifications although these are necessitated by changed conditions and are supported by authentic medical opinion.

May I cite as an illustration Clause 64, which declares five diseases to be notifiable. Three of these diseases have, for practical purposes, disappeared as industrial diseases. When I pointed this out I was informed by the Home Office that the reason for their inclusion was that 'as a matter of convenience we are in Clause 64 simply re-enacting Section 73 of the Act of 1901 in which those five diseases are mentioned. In the thirty-six years which have intervened since the Act of 1901 other diseases have become much more important notably for example, cancer of the skin, but no attempt to deal with these

is made in the Bill beyond a sort of blunderbuss clause (No. 151) that Orders made by the Secretary of State since 1901 remain in force and the certifying factory surgeon is saddled with the task of finding out what these Orders are. Surely it would be more sensible to cancel the regulation requiring notification of diseases which since 1901 have become practically obsolete and to schedule in the Bill all the diseases which would be notifiable under the forthcoming Act.

The moral to be drawn from this letter I submit is that there are too few medical Members of Parliament, and it is therefore all the more deplorable that Oxford and the Combined English Universities should have missed their opportunity of returning such distinguished members of the profession as Sir Farquhar Buzzard and Sir Henry Brackenbury—I am etc.

House of Commons April 19

E GRAHAM LITTLE

The Tavistock Clinic

SIR—The Council of the Institute of Medical Psychology have decided after much deliberation to change its title and revert to the original name of The Tavistock Clinic. I should like through your columns to notify the profession of this fact so that no confusion may arise in their minds.

The Tavistock Clinic was the original name adopted when in 1920 the work of providing psychological treatment was begun in a house in Tavistock Square. As the clinic grew its name became well known among the profession at home and also on the Continent and in the United States. A good many people seem hardly to have realized that it was changed some four or five years ago and to them there will seem nothing unusual in our new title.

The change has seemed advisable largely because of the constant confusion which arises as a result of the non-medical institutes of psychology and psychotherapy which have arisen during the past few years. Some of these have gone so far as to copy our literature and our stationery evidently feeling that this was likely to be of value to them. Any hospital is reluctant to change its name, because there is inevitably some loss of goodwill, particularly among those who support or might support the work. I am confident however that we can rely upon our many friends in the profession to see that such loss does not occur and that whatever good reputation the Institute of Medical Psychology had shall be carried over to the Tavistock Clinic, which certainly needs all the help that they can give it—I am, etc.,

HENRI B BRACKENBURY,
Chairman of the Council

The Tavistock Clinic, Malet Place
W.C.1 April 12.

The General Practitioner and Urinary Infections

SIR—The frequency with which the common complaint of pain, frequency of micturition and scalding is met and the hit or miss methods often adopted in its treatment lead me to think that the following may be of interest to my fellow general practitioners.

In all humility I describe a method of control that I have evolved in the midst of general practice which enables one to state with some certainty whether the condition is or is not yielding to treatment. Not for one instant do I suggest that the general practitioner should attempt to usurp the functions of the properly equipped and expertly superintended pathological laboratory in this,

connexion, neither does the method aim at any definite classification of the infecting organism. There are, however, many cases with which the practitioner himself has to deal and which, for one reason or another, it is not practicable to refer to the specialist.

I used to treat my cases of pyelitis and cystitis—after excluding gross pathological lesions to the best of my ability—with heavy doses of potassium citrate and five or ten minims of tincture of hyoscyamus in an infusion of buchu until the more unpleasant symptoms had subsided. If all went well I was fairly satisfied. If the symptoms persisted I followed the best textbook traditions and tried the effect of a sudden switch to an acidified urine and doses of hexamine in the hope of formaldehyde being liberated in the acid medium with antiseptic results. I administered the acid sodium phosphate mixture before meals and the hexamine after meals in the belief that the formaldehyde must not be liberated from the hexamine until the urinary tract had been reached if any inhibitive effect was to be exerted on the growth of the organisms.

Whether individual cases improved or not I always had the feeling that I was working in the dark. This led me to try to obtain assistance from my microscope. First attempts were with films made from a drop taken from the bottom of a urine vase after a few hours standing. Except in cases of gross infection the resulting slides were disappointing and showed little connexion with the clinical severity of the case.

The centrifuge seemed out of place in my surgery, and after experiment I evolved the following method.

Six to eight ounces of the urine—a catheter specimen in the case of women and a mid stream specimen in the case of men—are placed in a folded 12 inch filter paper in a large glass filter which has been previously sterilized and allowed to stand covered by a second unfolded filter paper to exclude dust. The time taken for the urine to pass through the paper gives a useful indication of the amount of mucin present. Phosphates and urates do not seem to hold up filtration to any great extent. The clear filtrate may be used to test for the presence of albumin. When only half an inch or so remains it is poured off and a film is made on a clean slide of the material removed from the sides of the filter paper near its apex with a sterilized platinum loop. The slide should be dried as rapidly as possible by waving it in the air and then stained by Leishman's method. In an acute infection with coliform bacilli a 1/6 objective is all that is required to show vast numbers of the bacilli epithelial cells with their large irregular outline and small nuclei, red blood cells if present and possibly renal casts. Urinary crystals may be seen but their presence in a film should not be taken as conclusive evidence of their presence in the bladder or urinary tract, since they (particularly oxalates) crystallize out so rapidly in standing and cooling urines and may be absent at body temperature. Later pus cells may become increasingly numerous.

Examination by this rapid method every five or six days gives one a very satisfactory indication of the success or failure of one's treatment quite independently of the patient's own description of his or her suffering. The latter is a most unreliable index since I have often found traces of a heavy residual infection in the urine of patients who have reported a complete cessation of unpleasant symptoms.

For the past year or more I have been using mandelic acid in the form of its sodium or ammonium salts together with ammonium chloride or acid sodium phosphate as an acidifying agent. Where the reaction has been kept at a pH of 5.3 or lower—not always an easy matter—and in the absence of a persistent cause of infec-

tion such as a calculus or diseased kidney, the results as shown by my periodical slides and the subsidence of the patient's symptoms have been most satisfactory.

The importance of maintaining the acid reaction of the urine in treatment with mandelates is I think, generally accepted and a simple control that may be used by the patient is furnished by the B.D.H. Universal Indicator, which gives the approximate pH from 3 to 11 corresponding to a variation of colours formed by the addition of a few drops of the indicator to half an inch of urine in a test tube.

Slides examined without cedar-wood oil will remain clear for several weeks and there is a fascination in watching a labelled series of films changing from a mass of organisms and cells to an almost clear slide that amply repays the slight extra trouble involved. When circumstances permit I send a specimen of the urine to a pathologist for culture as soon as I am getting fairly clear slides. The report that no pathogenic organisms have been grown on incubation is a most satisfactory termination to the case—I am, etc.,

Rookwood Reading March 26

E. E. S. WHEATLEY

Angina Innocens

SIR—Dr Geoffrey Bourne's article on angina innocens (*Journal* April 3 p. 695) and Dr A. G. Auld's letter (April 10, p. 784) will be of interest to every practitioner. A patient of mine had what I thought until last week was pseudo angina, or using Dr Bourne's new terminology angina innocens. He was 37 when he first consulted me eleven years ago. The pain was precordial radiated to the left arm and lasted a few minutes. Its relation to exercise was incidental; sometimes it came on when he was walking or playing golf but it would come on also when he was lying in bed or sitting down quietly in a chair. Its severity varied; it might be a dull ache or an acute gripping pain. Its frequency varied also; sometimes there were four or five attacks in twenty-four hours; sometimes a few days were free from pain altogether. There was no evidence whatsoever of cardiovascular disease by physical examination, radiograph, or electrocardiogram. His blood pressure was normal, his Wassermann reaction negative and the pulse rate usually between 80 and 90. He was seen several times by consultants who agreed that his was a case of pseudo angina. He was a nervous subject, and amyl nitrite did not relieve the attacks.

He like Dr Auld's patient fulfils all of Dr Geoffrey Bourne's criteria for angina innocens except that the course of the disease proved that it was not innocent. A week ago after having expressed the opinion earlier in the day that he had not felt so well for years and while sitting down quietly playing cards he died—I am, etc.,

Stewen Glamorganshire April 10

TREVOR DAVIES

Auditory Nerve Section

SIR—In the *Journal* of March 27 (p. 660) Mr R. Rutherford in his paper on operative section of the auditory nerve suggests that with the use of a suitably designed endoscope operative trauma might be reduced to a minimum. With the use of precise mathematical measurement it is shown to be possible to identify the internal auditory meatus with considerable precision and to expose the auditory nerve by the insertion of a graduated retractor to a calculated depth. Mr Rutherford goes no further than to show that the exposure of the nerve is practicable by his method but should the sug-

gested advantage of reduced tissue trauma be regarded as a recommendation for Mr Rutherford's procedure in preference to the open operation of Dandy, Cairns, and Mackenzie, some comparison should be made between the principles and technique of the two operations.

The extent of the operative exposure which Mr Rutherford has employed for the insertion of the graduated retractor—namely an opening in the skull two inches by one and a half inches—is no smaller than that employed by neurological surgeons at the open operation. If the external magna had been evacuated and had inhalation narcosis been avoided intracranial tension would have been reduced to such an extent that the auditory nerve could have been easily exposed through the approach employed. The passage of a retractor down to the auditory nerve if not carried out under direct vision would endanger the veins passing from the cerebellar cortex to the sigmoid and inferior petrosal sinuses.

The use of an endoscope with the necessity for dividing the nerve with a hook knife would carry the additional risk of injury to the anterior inferior cerebellar artery. The relations of this vessel to the auditory nerve are variable; it commonly lies between the facial and auditory nerves or between the cochlear and vestibular parts of the latter; it may form a loop in front of the auditory nerve in which situation it is especially exposed to injury. Haemorrhage from a vessel of such size would be disastrous for it could never be controlled through the narrow orifice of an endoscope. In the open operation the nerve can be perfectly exposed after the surrounding arachnoid has been incised and adjacent blood vessels can be either avoided or electrically coagulated. By transfixing the auditory nerve with a small right angled hook it can be drawn away from the facial nerve and any intervening blood vessels and the section can be limited to its vestibular portion. The latter procedure is of special value when some hearing still remains but it requires for its successful performance a standard of precision which could never be attained without the perfect exposure which only the open operation can afford.

The suggested method of the identification of the auditory nerve by its action currents would appear to be an admission not only of the inadequacy of the exposure as judged by the standards of the open operation, but also of the limitations of the accuracy of the original premises—I am, etc.,

Newcastle upon Tyne March 30

Medicinal Kaolin in Food Poisoning

SIR—Dr N Mutch in his article on medicinal kaolin in food poisoning in the *Journal* of March 20 (p 595) compares a number of commercial specimens of medicinal kaolin in respect of grittiness and sedimentation. He then selects one of these specimens and carries out a number of tests of its adsorptive capacity. From these results he draws certain conclusions as to the value of different methods of testing which do not appear to be entirely warranted by the facts.

It is well known that kaolin peptizes more readily in a neutral or slightly alkaline medium than in a slightly acid medium whereas its adsorptive power is greatest in an acid medium. Since it must be assumed that slight differences in reaction are neutralized in the body it follows that sedimentation tests carried out *in vitro* at different pH values are of little use as indications of what will happen in the body. Actually the difference in reaction between the two kaolins Nos 4 and 5 tested by Dr Mutch is quite sufficient to explain the slight differences in the rates of sedimentation.

The methylene blue test has been widely used as a means of comparing the adsorptive powers of different specimens of kaolin. It has the advantage of being

simply carried out and giving results which can be expressed as numerical values. (Incidentally on physico-chemical grounds the rational method of carrying out the test is to use an excess of methylene blue and to calculate the amount adsorbed after a definite time. The pH should also be adjusted to a standard value.) Dr Mutch condemns the methylene-blue test not on the ground that it gives anomalous results with different specimens of kaolin, but because the particular sample of kaolin which he examined in its adsorptive power for different dyes showed qualitative differences from magnesium trisilicate. Is there really any more ground for the selection of an arbitrary food poison as the test medium than an arbitrary dye? Dr Mutch does not suggest which of the food poisons is the most suitable for testing kaolin, nor does he give any comparative values for the adsorptive powers of different commercial kaolins, either for food poisons or dyestuffs. It seems possible that the anomalies might be just as great in the one case as in the other. In any event the comparatively simple conditions of testing *in vitro* must be vastly different from the complex environment occurring in the body—I am, etc.,

London, E.2, April 5

NORMAN EVERS, B Sc, F I C

Intranasal Ionization by Electrotherapists

SIR—It has recently come to my knowledge that certain masseurs and electrotherapists not medical men are claiming to perform intranasal ionization for hay fever and allied conditions, and are circularizing medical men for their support. While this may be done in all good faith, I think it only fair to both patients and doctors to point out that this treatment can be efficiently carried out only by those who, through practice, have familiarized themselves with the anatomy of the nose. If this form of treatment is to be successful attention to details of technique is essential. The nose is first sprayed with a 2 per cent solution of cocaine hydrochloride to allow for shrinkage and anaesthesia to take place, it is then carefully packed, by reflected light, with ribbon gauze soaked in zinc sulphate solution. It is imperative that the gauze be in contact with every part of the nasal mucosa. It would be a pity if this form of treatment for hay fever and spasmodic rhinitis should fall into disrepute owing to its being attempted by persons unqualified to carry it out—I am, etc.,

Bournemouth April 5

ROY SALKFELD.

Blood Sugar Worship

SIR—Dr Leyton (*Journal* April 10, p 782) states that I am mistaken in believing that hyperglycaemia without glycosuria or ketosis is as little likely to cause complications as a 'normal' blood sugar in a diabetic. I should like to know on what grounds he bases this statement and whether he considers that hyperglycaemia alone produces the complications?—I am, etc.,

London SW1 April 11

OLIVER WALKER.

Reaction Time of Motorists

SIR—I have not heard nor read of it being suggested that the reaction time test as applied to those wishing to be aviators could be used in the case of the motorist whose 'fitness to be in charge' is under question. I think we are all agreed that 'slowness of reaction' is the chief cause of a motorist being a danger to himself and to other road users. Could some authority on the use

of such a test say if its employment would be practical, clinically and financially?

We accept 60 to 80 as a normal pulse rate by investigating a large number of motorists (say a thousand) a wide normal reaction time could be gauged. The test would be applied at the time of the primary examination at the police station, and the next day the results of a second test would be compared. Those who have been cross examined know too well what a boon it would be to have a test that was as near certain as possible—I am, etc.,

Hampton Middlesex, April 9

G C L WOODROFFE.

Alcohol and Motoring Accidents

SIR,—In view of the recent mock trial (*Journal* January 23, p 128) the following case may be of interest

A motorist had a fairly severe accident with head and left hip injuries and on recovery was warned that alcohol would act with more than usual strength but he was allowed a little cider. Six months later I was called to see him at a police station at 8 a.m. and heard the following story: he had had an evening with friends and had taken a few glasses of cider. Later he had gone to a night club where he had ordered non-alcoholic beer. He took a friend's glass of wine as a mild practical joke. Driving home to a distant suburb at about 2 a.m. he felt extremely drowsy and as he thought himself a danger on the road he turned into a quiet side road and slept peacefully till 7 a.m.

He awoke stiff and in not too good form backed his car to turn out and sent his rear wheel and truly into a lamp post. On getting out to see the damage he was seen by a passing constable who said that he was unsteady and drunk in charge. At the police station I was informed that the police surgeon had already certified to that effect before I was called. At 8.45 a.m. the patient was somewhat irascible his tongue was furred his eyes were very bloodshot tendon reflexes were exaggerated ocular convergence was slightly defective and the pupil reactions were normal. Writing and diction were normal walking was not quite perfect but this might have been accounted for by his hip injury.

I was prepared to say that at the time I saw him he was quite capable of driving, but if pressed I should have had to admit that I thought him to have taken during the evening and night considerably more alcohol than he admitted, and I should not have been very strong if asked my opinion of his probable condition one and three-quarter hours before I saw him. However if his story was correct he had had very little alcohol and all of that at least six to nine hours before the incident. In other words an estimation of the blood alcohol ought to have demonstrated his truthfulness or otherwise. The figure obtained was 0.003 per cent and his solicitor who had even considered the wisdom of pleading guilty was able on that evidence to have the case dismissed.

—I am, etc.

F HARWOOD STEVENSON, M.D., M.R.C.P.

Edgware Middlesex April 8

Local Anaesthesia for Perineal Tears

SIR—I was interested in Dr Stanley Way's communication on local anaesthesia in the repair of the torn perineum (*Journal* April 10 p 753) and I agree that general anaesthesia is often undesirable and unjustifiable. I do not think however that infiltration of all the tissues is the method of choice in producing analgesia as soddening in a potentially infective area is certainly not desirable.

I have found that all that is needed in the way of anaesthesia is the raising of a wheal by the intradermal injection of 1 per cent novocain at the site of the proposed suture on either side of the tear. When no local anaesthetic is used very little pain is experienced on intro-

ducing the needle but in its exit through the skin of the opposite side there is a great deal of pain. A series of two or three wheals may be raised by a single cutaneous puncture and this minor operation may be conveniently carried out with the patient in the left lateral position.

I always use silk-worm gut sutures in preference to absorbable sutures, as with the latter there is a greater local reaction during the process of absorption, which thereby increases the liability to infection—I am, etc.,

TREVOR HUGHES, L.R.C.P., L.R.C.S., L.R.F.P.S.

Ruthin April 12

SIR—I read with interest Dr Stanley Way's article on the use of local anaesthesia in the repair of a torn perineum. As a general practitioner I have been using local anaesthesia for some time in repairs, and have never had a case break down or go septic and this method rather than general anaesthesia has been much preferred by my patients. I have lowered the number of tears in my own cases by doing a routine episiotomy under local anaesthesia. I use as a rule 2 per cent novocain in a 2 c.c. syringe, and just prior to crowning and while the pains are at a maximum infiltrate the labia at the usual site on both sides with 1 c.c. of local anaesthetic: the incisions and subsequent suturing can then be done painlessly—I am, etc.,

East Bergholt, Suffolk April 12

J R B McBRIDE.

Erysipelas Treated by Prontosil

SIR—The importance and interest of the prontosil treatment of streptococcal infections leads me to follow the example of my friend and neighbour Dr W H Palmer (*Journal* February 27, p 472), by putting on record my experience of prontosil in three cases of facial erysipelas which I have dealt with in the past three weeks.

The first case was in a woman of 60. When first seen the right external ear and adjacent part of the face showed typical erysipelas of moderate severity, with great pain and the usual constitutional disturbance.

Prontosil album the oral preparation two tablets thrice daily was prescribed. Within twenty-four hours the condition was checked and progressive improvement followed.

The second case in a woman of 30 was of a very severe type. Both eyes were closed there was intense conjunctivitis, a rapid march of the line of induration, severe pain and prostration with a temperature of 103.5 F. This case was admitted to hospital and had one injection of prontosil in addition to the two tablets of prontosil album thrice daily. Four short wave treatments of five minutes duration were also given. In a matter of hours the spread was checked and the pain greatly relieved. Within forty-eight hours the temperature fell to normal and there was no further rise.

The third case was in an old woman of 79 bedridden all winter with severe bronchial catarrh and cardiac debility. The onset of severe facial erysipelas involving in a few hours the whole face appeared to be a terminal complication. She had a temperature of 103° F, dyspnoea and cyanosis, severe pain and distress. However I put her on prontosil album two tablets thrice daily and by the following day she felt better. Another day showed obvious improvement and by the third day she was out of danger.

—I am, etc.

Camborne April 7

R H BLAIR

The Birching of Children

SIR—Dr P G Bantley in discussing the punishment of children (*Journal* April 10 p 785) seems like many writers on this subject to be inconsistent. In his third paragraph he says: "A mischievous spirit is part of every healthy boy's character and if punishment is given,

painful though it may be, he accepts it as part of the game. In his fourth paragraph he says 'The increase of juvenile crime during the last ten years has been a difficult problem to tackle but I am of the firm opinion that corporal punishment carried out humanely and with every consideration for the particular case in point is a far better method of controlling crime than a lot of indiscriminate dabbling with a science about which so few of us know so very little'.

Thus in one paragraph Dr Bentlif approves and applauds the mischievous spirit that results in juvenile crime and in the next he is advocating a means of controlling or at least partially suppressing the manifestations of that spirit. He apparently regards the administration of justice as a game not as a means of preventing crime and curing or deterring criminals—I am, etc.,

J E J PALSER M.R.C.S., L.R.C.P.

London N 10 April 9

SIR—Dr Bentlif's letter on the birching of children is inspired by his personal experience in seeing this punishment carried out but I believe it is a fact that there is considerable variation in the severity or otherwise with which the flogging is administered, and it would appear that in Jersey justice is tempered with mercy¹. It is not always so, however, and I could quote instances in which the victim does not appear to have got off as lightly as the cases mentioned by Dr Bentlif.

However, I am not so concerned with the physical side as with the psychological, and here Dr Bentlif will find his opinions in opposition to those of the vast majority of those well qualified to judge. Thus Sir Walter Langdon-Brown writing in the *Daily Telegraph* says 'Medical psychologists are unanimous in their disapproval of a barbarous practice which does even more harm to the mind than to the body and has a diametrically opposite effect to that presumably intended'. I could quote many such opinions. Dr Bentlif's view that juvenile crime can be controlled by the infliction of corporal punishment is completely at variance with the facts. Some time ago the Board of Education published an investigation showing that no less than 80.34 per cent of boys who had undergone a judicial birching had been recharged within two years. Mr Justice du Parcq speaking from the Bench on December 5, 1933, said, 'In my life's experience I have always noticed that a judicial child-flogging is the first sentence in tragedy of a life of crime'. At Ealing Juvenile Court last month three boys who had been birched only a fortnight before on a charge of theft again appeared, charged with a similar offence. Dr Norris, chief inspector of the Children's Branch of the Home Office, gave his opinion that police court birching is not effective, and I would like to see it abolished.

Dr Bentlif seems to think it is the business of the law to punish, but it is not, except when it acts as a deterrent from further anti-social behaviour, and all the facts show that the birching of juveniles completely fails in that respect. A thrashing administered by parent or teacher in the familiar surroundings of home or school is one thing, but one carried out under the circumstances portrayed in the leading article in the *Journal* (March 20, p. 618) which led to my first letter is quite another. However little respect Dr Bentlif may have for the science of psychology, I still maintain and so do those far better qualified to speak than I, that such punishments are as harmful as they are demonstrably ineffective—I am, etc.,

Hove Sussex April 11

W N MAPLE

Inhalational Therapy

SIR—As one of the three trustees for the Duke-Fingard inhalational treatment I feel compelled to say a few words in answer to your correspondent's letter published on March 13 (p. 587).

I have been conversant with this particular form of therapy for the past two years, and am quite convinced of its undoubted value in selected cases. I am also well aware of the ethical policy which has been adopted in every instance, and therefore cannot allow to go unchallenged certain remarks made in Dr Boswell's letter.

I feel that Dr Boswell is erring when he states that his patient answered an advertisement in the lay press. No such advertisement to my knowledge has ever appeared. A film actor, it is true, attained a deal of publicity following benefit obtained from the inhalation, but this can hardly be construed as an advertisement. Dr Boswell also stated that his patient was 'referred to a medical man'. An imputation of this nature stands in need of immediate correction. In order that patients may be spared the trouble and expense of unsuitable treatment, and that their medical attendants may be given every facility it has been the policy to suggest to these patients that they might care to consult one of the many medical men experienced in the treatment, and to ascertain what benefit, if any, they may hope to receive.

Dr Boswell attributes the unfortunate death of his patient partly to the abrupt change in temperature experienced in passing from the warm treatment room to the cold outside air and partly to the inhaled vapour. One cannot help but feel that his abrupt change against which every patient is warned, should not have been permitted, and that any ill effects however produced, should have been noted and the treatment modified accordingly. Obviously one cannot merely switch on and leave the rest to the machine—I am, etc.,

H B FAWCUS M.B., B.S., D.P.H. Camb

London SW 1 April 7

SIR—I was much concerned over Dr Boswell's letter in the *Journal* of March 13 regarding effects of chill following the Duke-Fingard treatment which ended fatally. I have had both personal experience in my own case and experience in treating patients by this method, being the first medical man in this country who tried out this new therapy. My first two cases were those of confirmed bronchial asthmatics who were sufferers of over twenty years standing. These were both cured and have remained so, and thus was awakened my deep interest in the treatment. I have also followed its progress in various hospitals and clinics.

Bronchitic patients are a chilly race and cannot take sufficient exercise when out to keep the body warm in cold weather. Their bronchial mucous membrane is sensitive and liable to be affected by cold, also their vasomotor systems are unaccustomed to rapid changes in temperature and therefore this class of patient must be managed accordingly. Dr Boswell is quite right in his conclusion that it is unsafe for a patient to spend his nights in such a warm medicated atmosphere and to go out by day into the rigours of our climate, but I would add that in my experience it is quite safe to do so if precautions are taken. I never allow a patient to venture out after treatment till sufficiently cooled down which takes roughly an hour. Another matter that is worth attending to with these imperfectly aerating folk is the taking of something warm on going out if the 'something' is alcoholic it is injurious as alcohol dilates the surface vessels of the skin and increases heat loss when out of doors, and they have no body heat to lose. Let it be a warm fluid—milk tea or a drink of beef tea with some condiment in it. They are too scant of breath to endure the weight of heavy clothes so these should be light enough to be borne warm enough to

keep them from catching cold. If further precautions are deemed desirable I may say a word on the merits of the unsightly respirator after treatment in these cold days or a warm muffler. This stops the cold air from chilling the respiratory tract. Regarding the odour it is distinctive and penetrating and certainly does linger in the house somewhat, particularly if the house be not flushed with fresh air but if an ozone apparatus be installed in the house and used for an hour or so after treatment the odour vanishes. This tip I learnt from a colleague.

I can assure Dr Boswell that I have never experienced any qualms over any patient I have treated by this method (and some have been under treatment over a year) provided the patient was a suitable case—I am, etc.

Weybridge April 8

A C GREENE

Falling Mantles

SIR—In your issue of March 27 (p 665) under the title of "The Mantle of Whitridge Williams, you review the seventh edition of Williams's *Obstetrics*. This excellent work is deservedly praised, but one sentence of the review states: "A few typographical errors have escaped detection. I have read the book almost through, and I find that far from being a few there are very many typographical errors. This brings me to the point of my letter. Why do medical authors read the proofs so badly? I have noticed this defect in other medical works particularly in books which have been taken over by a new author and revised. Whole pages appear to be passed over without being looked at, and errors in the original work are perpetuated. I could name many works in which I have noticed this defect. It is most annoying when trying to take an intelligent interest in the subject-matter to find the statistics the wrong way round, or a reference to an illustration which has been left out, or a reference to a page in the last edition. I feel it is up to medical authors to take a little care over the production of their works or else the mantles will soon fall off—I am, etc.

Dublin April 8

E E D GRAY M.D. M.R.C.P.

Prevention of Silicosis

SIR—It was unnecessary and irrelevant, since Mr McLachlan believed his microbiological growth suggestion means then it is only natural that it [coal] will adsorb dyes (*Journal* March 27 p 686) that he should have asked for my evidence that coal dust was an adsorbent. And much more so that having so needlessly been troubled to advance it, one's obligation should be transmuted into a species of affront by its requester.

For the rest it is of course obvious that in dispersing iodine toxic doses should not be used. The same precaution would be required but more so with ultra violet rays which must be applied gradually even in daylight under resting conditions. How much more so in the relative darkness of a coal pit for example under the strain and perspiration of hard manual labour. The use of electrical devices is moreover being more than ever discouraged in coal mines because of explosive danger—which is a very practical reason for preferring iodine—so that such an alternative cure might be worse than the disease not only as regards application but also as regards positive explosive danger. Neither do the relative expense and intricacy of ultra violet rays commend themselves quite apart from the relative difficulty of disseminating them. Unlike vapours rays do not diffuse automatically and permeate every space. Mr McLachlan seems to confuse the adsorbent with the material adsorbed. It is of course the former not the latter which is more

definitely-particulate. And in any case until further advance can satisfy a still-searching scientific world how far there is an approach by the size of the smallest "particles" ingested to the size of molecules the question of monomolecular films seems premature. He would be indeed bold who should state the size of the finest ultra microscopic particles ingested into the lungs without approaching the molecular boundary. Premature also would seem the conclusion for the preceding reason that there is no adsorption after the examination of but one lung specimen. And in any case no adsorption of what? As Mr McLachlan would expect the adsorption to be of the order of monomolecular thickness, it is difficult not to wonder how he arrived at so definite a conclusion so very rapidly—I am, etc.

Why "Nocifensor"?

SIR—The letters of Dr F J Allen (*Journal* March 27, p 687) and of 'Lucifer' (April 10, p 786) make me yearn to continue this correspondence and hear some more 'barbarous howlers'. "Lucifer" would be wise to hide his light under a bushel since apparently, after he and his friends have blushed, "the fact remains that *noceo* turns into *nocivus*, *medeor* belonging to the same group into *medicabilis* and *medicatio*. It matters little that *nocivus* like *noctivus* is very rare in Latin. But *medicabilis* and its companion happen to be derived from *medicor* (-atus), although I freely admit that *medicus* and *medicina*—common Latin words—are derived from *medeor*.

Dr Allen says that years ago he called attention to the fact that 'for verbs in -eo the compounding stem ends in -u'. It is a pity that no one has corrected him in the interval. Since he believes that *nocifensor* is as wrong as document it seems worth while to point out that the rather common English words 'doctor' and 'doctrine' are, like the rare Latin word *documen* derived from *doceo*. Since I am innocent (from *in noceo*) of any monstrous motives (both from *monito*), I hope Sir that I shall not be prohibited (from *prohibeo*) from timidly (from *timor*) admonishing (from *ad moneo*) him that the horrid (from *horreo*) letters M.D. after his name do not stand for Medicinac Doctor—I am, etc.

Oxford April 10

'PETER SHAW

Oral Surgery Club

SIR—May I beg the courtesy of your columns to bring to the notice of those of your readers who may be interested the fact that an oral surgery club has been formed in England.

The club has been formed with the object of advancing the science and art of oral surgery by providing for contact between its members also by arranging visits to various British and foreign centres for the purpose of seeing work done by different surgeons. Membership is confined to those who specialize in oral surgery or hold a hospital or other appointment embracing surgery and who possess a medical or dental qualification. The following have agreed to serve on the first committee: *President* Professor T Talmage Read of Leeds, *Members of the Committee* Major S H Woods A.D.C. Mr T Hall Felton of Grimsby. If any of your readers are interested and would like information I would be pleased to hear from them—I am, etc.,

R S TAYLOR
